"The Oldest
American
Fire and Marine
Insurance
Company"

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

PHILADELPHIA

and the

This College Is Waterproofed With "ANTI-HYDRO"

The concrete foundation walls and basement floors in the Music Building and many others comprising the North Carolina College for Women are waterproofed with "ANTI-HYDRO."

These Buildings were not all erected at the same time. But after once using "ANTI-HYDRO," results were so satisfactory that "ANTI-HYDRO" was used in all later buildings.

"ANTI-HYDRO" has so thoroughly and permanently waterproofed the concrete foundations that the rooms below grade are absolutely dry and usable at all times.

"ANTI-HYDRO" is dependable, economical and extremely easy to use. It is a liquid integral compound, which when added to the mixing water makes concrete permanently hard and waterproof in one operation.

Twenty-five years of continuous use have taken all the doubt out of "ANTI-HYDRO."

Results are guaranteed permanent. For satisfaction, for economy, for proved results use "ANTI-HYDRO" on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Pacqualle, James and Buttonwood Streets, Norristown, Pa. Stone 2½ stories, 16x40 feet, shingle roof, hardwood floors, hot water heat, electric light, tile work.

Pennsylvania Contracts Awarded

Liberal Arts Building (second unit), State College, Pa. Contract awarded Berkebile Brothers, Johnstown, Pa., not yet signed. Architect, Charles Z. Klauder, 1429 Walnut street, Philadelphia. Owners, Pennsylvania State College, State College, Pa. Brick, reinforced concrete, limestone, steel, granite, 2 stories and basement, 112x57 feet, composition roof, concrete floors, metal lath, tile, marble and terrazzo work, rolled steel sash, bond, ornamental iron work, bluestone.

Apartment House, 345 North Lansdowne avenue, Lansdowne, Pa. Contract awarded Williard Swaab, Crozer Building, Philadelphia, who is taking sub-bids due at once. Work to start in two weeks. Architect, Henry E. Johnson, Jr., 266 South Fifteenth street, Philadelphia. Owners, 345 North Lansdowne Avenue Corporation, W. R. Eddelman, 711 Stock Exchange Building, Philadelphia. Brick, steel, concrete, 6 stories, 60x150 feet, 60 apartments, slag roof, hardwood floors, elevators, vapor heat, electric light, oil burners, tile and marble work, rolled steel sash, kalamein doors, incinerators, kitchen and laundry equipment.

Office Building (alts.), Scranton, Pa. Contract awarded S. Sykes & Sons, 1229 Penn avenue, Scranton, Pa. Architects, Davis & Lewis, Scranton Elec. Building, Scranton, Pa. Owners, Scranton Elec. Co., Linden street, Scranton, Pa. Reinforced concrete, structural steel, waterproofing, cement floors, slag roof, brick, structural tile, sheet metal, metal lath, plastering, ornamental iron, iron work, iron stairs, steel casement windows, area gratings, metal doors, tile, marble, oak and pine floors.

Church, Scranton, Pa. Contract awarded John Bernatovitch, Scranton, Pa. Architect, A. J. Waard, County Bank Building, Scranton, Pa. Owners, Ukranational Church, Scranton, Pa. Brick, stone, steel, 40x90 feet, slate roof, yellow pine floors, electric light.

Store, Restaurant and Living Quarters, Clifton Heights, Pa. Contract awarded Adolph Korn, Lansdowne, Pa. Architect, Charles H. Jester, 131 South Fifty-second street, Philadelphia. Owner, Megard Halfpenny, Clifton Heights, Pa. Brick, 2 stories, 40x75 feet, slag roof, pine, oak and linoleum floors, metal ceilings, hot water heat, electric light, tile work.

Residence and Garage, Loraine Tract, Rydal, Pa. Contract awarded H. W. Specht, Willow Grove, Pa. Architect, John A. Bower, 1518 Walnut street, Philadelphia. Owner, G. Bertram Rager, Noble Vista, Pa. Stone, brick, stucco, 2½ stories and basement, 94x30 feet, slate roof, oak and pine floors, cement work (linoleum and electric reserved), hot water heat, tile work, steel casement windows.

Store (alts.), Norristown, Pa. Contract awarded F. B. White, 1509 Juniper street, Norristown, Pa. Architect, E. Lane Crawford, Norristown, Pa. Owner, Isaac Johnson, 1352 Powell street, Philadelphia. Brick, 1 story, steel, 22x68 feet, maple floors, plate glass, hot water heat, electric light.

Church, Fullerton, Pa. Contract awarded Arthur P. Hauser, Emaus, Pa. Architects, Ruhe & Lange, 12 North Sixth street, Allentown, Pa. Owners, St. John's Reformed Church, M. Newhead, Fullerton, Pa. Stone, brick, 1 story and gallery, seating capacity 500, slate roof, maple floors, hot water heat, electric light.

Bakery (add.), Bethlehem, Pa. Contract awarded E. E. Garber & Co., 203 West Fourth street, Bethlehem, Pa. Architects, Wiegner & Synder, Bethlehem Trust Building, Bethlehem, Pa. Owners, Bethlehem Baking Co., 535 Second avenue, Bethlehem, Pa. Brick, steel, slow burning, 2 stories and basement, 40x140 feet, slag roof, wood deck, reinforced concrete floors, roof ventilators, waterproofing, area gratings, steel skylights, steel sash.

Residence, Wallingford Hills, Pa. Contract awarded Powell Construction Co., Ardmore, Pa. Architect, private plans. Owner, Frank C. Hartzel, care of builder. Stone, frame, stucco, 2½ stories and basement, 47x28 feet, slate roof, oak and pine floors, vapor heat, electric light, ornamental iron work.

Warehouse, Allentown, Pa. Contract awarded W. H. Gangwere & Co., A. N. B. Building, Allentown, Pa. Architects, Jacoby & Everett, Commonwealth Building, Allentown, Pa. Owners, Hill Metal & Roofing Co., C. S. Shelley, 90 North New street, Allentown, Pa. Brick, steel, 1 and 2 stories, 44x125 feet, steel reinforced deck, concrete floors, steel sash, kalamein doors, cast stone, concrete block.

Repairing, Ford street, West Conshohocken, Pa. (Bridge to West Borough Line). Contract awarded Union Paving Co., 123 South Twenty-first st., Phila., \$8,670. Owners, Borough of West Conshohocken, Pa. 20 ft. wide almost, 1 mile long, bituminous composition of trap rock.

Road Work, Pennsylvania. Contracts awarded. Owners, Pennsylvania Department of Highways, Harrisburg, Pa.

Chester County, R-605, East Nottingham and Elk Townships. Grading and drainage.

Pictured above is the \$2,500,000 Reinforced Concrete Unit of the \$10,000,000 project of The Walnut Plaza Co., at 63rd and Walnut Streets, Philadelphia. It was erected in 69 working days by Frederick Massiah and is one of Philadelphia's largest beam and girder jobs.

RECOMMENDED PRACTICE FOR BUILDING CODES

Excerpts from Reports of Building Code Committee of the United States Department of Commerce, Elimination of Waste Series, July 15, 1925. Sold only by the Superintendent of Documents, Government Printing Office, Washington, D. C. Price 10 Cents

The building code of a city is its fundamental law as to what building materials can be used and how they can be used. The interest now being shown in building code revision makes this article especially timely, as fair codes are essential if the construction industry is to prosper.

These recommendations are a valuable contribution to the science of Building Code legislation. They consist of (1) an introduction, (2) recommended outline for building code and (3) appendix. Quotations in part, read:

Building ordinances may originate or be revised by several different methods or agencies.

1. Civic Organizations.—Codes may be drafted or amended by independent civic bodies such as chambers of commerce or citizens' associations, or by organized ef-

fort of some group affected directly by code requirements, the suggestions being adopted by city legislative bodies. This procedure does not as a rule accomplish the best results unless the persons selected for the task are specially qualified. Recommendations thus prepared are liable to overemphasize subjects in which such groups are interested, and the resulting ordinance is not well balanced. On the other hand, civic or commercial organizations can perform a useful function by calling attention to the need of code drafting or revision by forcing initiation of the work.

Professional and trade organizations have much that is valuable to contribute, but no one group will usually have the time and energy to complete such a large undertaking. There is also the danger that suggestions from any one source or group will not be broadly enough considered.

2. Building Officials.—Building codes often are drafted or revised by building officials, subject to approval by municipal legislative authority. Some excellent codes have been prepared in this manner where the building officials happened to be particularly well qualified for such service. Generally, however, a building official alone should not be held responsible for the preparation of the ordinance. There is need for more than one viewpoint on the problem, and the building official, moreover, is often too busy to give such work the time and attention it requires. He is in an excellent position to criticize such legislation from the practical standpoint of enforcement and can render invaluable co-operative service with a properly selected committee.

The building officials in many cities are empowered to interpret or add to code requirements by rulings, which, after due notice and public hearings, assume the force of law. Such a procedure is necessary and desirable. A code, no matter how carefully prepared, will need further interpretation. Such interpretations are better published, for otherwise they remain unknown except to local designers, and their correctness or justice is not thoroughly subject to public and professional scrutiny.

The Department of Commerce building code committee advocates publication of an appendix with all codes, which will provide in part for such interpretation and aid in supplying the data upon which changes should be based.

3. Local Code Committees.—When the drafting or extensive revision of a building code becomes necessary and it is desired to avoid the expense of a specialist by utilizing the knowledge and experience of the building official and of local technical and industrial groups, this is most successfully accomplished by organizing a committee representative of all

groups affected. It is, of course, necessary that these men be experienced in their particular lines, and that they have the confidence of their respective groups. They should be selected not alone for their technical ability but also for their capacity to work together effectively in committee procedure. Sometimes outstanding ability may be sacrificed to advantage in order to get men who can see both sides of a question.

The membership should, if possible, be selected from men having some years of experience in architecture, engineering (structural, sanitary, or fire prevention), or may include any specialist in public utilities, foundation work, or building erection who may be available. The chief building official should always be a member. The chief of fire department is also a good man to have on such a committee. Sometimes a well-qualified mason or carpenter can be utilized to advantage. Legal talent can be included, if desired, but usually such assistance is not necessary except to review the finished ordinance to ascertain if it is in binding legal form.

The size of such a committee must depend upon circumstances, but usually five members make a satisfactory working body. A large committee is liable to become unwieldy, though it may sometimes function effectively through subcommittees to which specific parts of the work are submitted for preliminary investigation and wording.

The members qualifying for such service will be busy men and seldom able to give more than a small part of their time to the work. It will usually be necessary, therefore, to employ a secretary capable of carrying on, under direction, the clerical and research work necessary to put the code provisions in shape for discussion by the committee.

In drafting a local building ordinance, recognition must always be given to any existing State building code or special building laws, and assurance made that the local requirements are at least as strict as the State Laws. It is permissible to make local laws more restrictive than State laws, and frequently desirable to do so, for the latter are usually minimum requirements applicable to all municipalities within the State and do not take into account local fire or other hazards which may exist.

4. Special Consultant.—It is best, though not always possible, to secure the services of an architect or engineer experienced in this type of work to write a building code. The services of a specialist are usually expensive as to first cost, but, as in many other fields of endeavor, they will prove well worth while in the end.

Unless a building code is drafted with extreme care concerning the correctness of its numerous requirements and their relation to each other, obsolete provisions are apt to creep in, also unexpected applications develop which are objectionable

and expensive. There is, furthermore, an essential difference between a building specification and a building code, based on the police power, which those who draft building codes frequently fail to appreciate. Codes written by competent architects and engineers often take the form of specifications for good practice instead of stating minimum safe limits. Even definitions frequently are written as specifications. In such cases the result is a code which, because of its numerous detailed requirements, is only partly enforceable, and which is in effect a law applying to the conscientious, but little heeded by those who need regulation most. This pitfall a specialist is more apt to avoid, with greater resultant economy and freedom of structural design. His practice keeps him constantly in touch with the great mass of investigational work being done by laboratories and professional groups and enables him to utilize the latest discoveries in each field. Such a specialist should always work in conjunction with a local advisory committee, and their joint recommendations should be freely submitted to those interested and should be discussed at public hearings before enactment by the local legislative body. . . .

The Value of a Building Code

Even when the need of a modern code is recognized it is often difficult to obtain the necessary funds for its preparation because the benefits which accrue to a community, although tangible, are particularly difficult of estimation in direct financial terms.

The great advantage resulting from the adoption of such an ordinance is the general betterment in character of buildings, which in turn improves the city's appear-

ance, benefits health conditions, and diminishes the fire hazard. A proper building code, well enforced over a period long enough to influence the character of construction, reduces the probability of fire spread in individual buildings, and lessens the conflagration hazard. Insurance underwriters, in grading a city according to its fire hazards, as a foundation for establishing a base rate, give credit for adequate building laws and good construction to an extent varying 15 to 25 per cent. of the total number of points employed in the grading.

In addition to this pecuniary advantage to the citizen as a whole, there are usually substantial reductions in premiums on insurance policies covering individual buildings, resulting from the improved construction required by ordinance. The total of such reduction aggregates a considerable financial sum. . . .

Copying of Existing Codes Unwise

Sections or articles most emphatically should not be copied verbatim from other codes without careful study of their fitness; and particularly to determine if they conform to standards of uniformity recommended by the Department of Commerce. Many of the defects of existing codes result from this practice. The code from which sections are "lifted" may be an excellent one, but if the borrowing is not done with great care the result will be a disorganized accumulation of requirements, inconsistent with each other, and out of harmony with recent developments.

The same careful scrutiny should be given a code in process of revision. Conflicting requirements or those which no longer apply should be omitted. Amendments are apt to have wider ramifications than is first apparent. . . .

ident's Unemployment Conference. Dr. Gries notes that the construction of two-family houses is steadily decreasing in importance.

"Overbuilding of apartments, which are built to rent does not have such an immediate effect upon new construction; even where new apartments are not needed they may be partly occupied, and they may be sold to investors who are not well informed as to local conditions," Dr. Gries reports.

"The desire of families to live in more satisfactory homes and surroundings has been the force behind the large home-building program. As has been customary, the new houses erected in and around cities have been for families in the upper income groups, with comparatively little construction for families in the lower groups which for the most part occupy less desirable structures.

"The private automobile and the bus, with improved roads, have greatly enlarged the area within which dwellings may be located, and have permitted comparatively open developments in attractive locations to an extent that would not have been possible before the war. The demand for outdoor recreation favors the home situated away from the center of the city. The families' enlarged radius of movement due to the automobile, together with the neighborhood movie, the radio, and shorter working hours, strengthens the call toward the suburbs. One-family dwellings when not erected by the occupant, are almost always erected for sale.

—Building Developer.

PAINT STILL AN IMPORTANT ESSENTIAL OF OUR DAILY LIFE

While its true origin has not yet been discovered, the genealogy of paint unearths a long line of historical antecedents. Indeed, it can be traced as far back as Noah's ark. Equally as interesting as its age, however, is the fact that paint has not been placed aside as an antiquated idea, but still remains an important essential of everyone's daily life.

Whether the practical use of paint as a preservative preceded its esthetic importance may, too, remain a mystery. But it does serve both purposes equally well, and the question—a much disputed one—is interesting.

It may be that the first men, seeking shelter from the fierce and glaring suns of Biblical countries, constructed rude huts. Of perishable nature, these would rapidly decay, and it is probable that the occupants in seeking artificial means of preservation hit upon the pigments of the earth in their search. It is natural to suppose that the instinct of preservation led to such a discovery, although a desire to imitate the colorful beauties of nature may have prevailed.

LITTLE ATTENTION PAID TO HOUSES FOR FAMILIES WITH SMALL INCOMES

Building of single family houses has been the outstanding development in the field of residential construction during the past decade in the United States, according to Dr. John M. Gries, author of one of the chapters of the survey of the National Bureau of Economic Research. The survey will be published shortly with the report of the Committee on Recent Economic Changes of the Pres-

MARBLE MOSAICS TERRAZZO CERAMICS TILES

that will satisfy the most particular.

From the Bible comes the earliest record of the application of a preservative to a wooden structure, when Noah painted the ark inside and out with pitch. Whatever the pitch lacked as a method of decoration, it was a triumph of preservation.

At a very early date ornamentation in color comes to light. In ancient Babylon the walls were covered with representations of hunting scenes and combat. They were done chiefly in red, and the method followed was to paint the scene on the bricks at the time of manufacture, assuring permanence by baking.

In Egypt the records of the kings were painted upon the walls of the palaces, temples and tombs. And at that time, over twenty-five hundred years ago, the Egyptians came into possession of a varnish which was composed of materials very little different from those used today. The wooden mummy cases brought from Egypt recently exhibit for proof the durability of this preservation.

The Greeks recognized the value of paint as a preservative and made use of something resembling it on their ships. Pliny writes of the mode of boiling wax and painting ships with it, after which he continues, "neither the sea, nor the wind, nor the sun can destroy the wood thus protected."

At a somewhat later period the Jews adopted many customs of the people who obtained power over them, and in the Apocryphal book of the Macabees is found this allusion to the art of decoration: "For as the master builder of a new house must care for the whole building, but he that undertaketh to set it out and paint it must seek out the things for the adorning thereof."

The aboriginal Indians used colors and drawings on their skins and bark to record events in their lives and the traditions of their tribes. They also painted themselves with ochre and clay to terrorize their enemies. Their skin tents were painted with figures of birds and animals. The Alaskan Indian also carved and decorated his totem pole in color to record the deeds of his ancestors and his own history.

And so down through the ages paint has proven its right to supremacy by surviving the relentless tests of time. Through the progress of civilization its importance as a protector and beautifier has increased, with nothing invented to take its place.—*East Bay Builder.*

APARTMENTS—HOW TO PLAN THEM

By F. A. McNALLY

McNally & Quinn, Architects and Engineers, Chicago

The prevailing trend towards tenant ownership type of occupancy for apart-

ments in the various metropolitan centers of this country during recent years has put to a test the ingenuity of the architectural and engineering professions because of the many special requirements demanded by the buying public. The purpose of this article is to present a few germane features which might well be given consideration in the planning of buildings of this type. No doubt most apartments built to be rented may be benefitted by the incorporation of some or all of the features hereinafter set forth, but their absence will be felt to a greater degree in the modern co-operative apartment building.

Developers, with the idea of erecting co-operative apartment buildings, often wonder as to the relative merits of several pieces of property available. A corner lot, with its principal exposures being other than north, is one which can be most advantageously developed. The elimination of northern exposures exclusively for the principal rooms of any apartment building is an essential feature. Where the selection of an inside lot is under consideration, the occupancy of the adjacent property should be studied thoroughly. Quite often inside lots, opposite public parks, bodies of water, et cetera, may be developed in a fashion comparable to corner lots.

A building located on a corner lot should have as many units as possible facing the principal street.

Too wide a range in the size of the units of any one building should be avoided, as quite often it is found that the intermingling of tenants whose living requirements range from the smallest to the largest apartments, militate against the final purchase of either type.

Several successful buildings erected on corner lots in the Chicago district have dispensed with apartments facing the side

streets, even though the lot may seem not to have been developed to its maximum capacity. This method of planning makes every apartment equally well located and the developer is not forced to overprice or underprice his units to arrive at his average selling price.

The entrance lobby on the ground floor need not be too large. It should be simple in detail and attractively furnished to impart a residential atmosphere to the structure. The incorporation of large elaborately furnished and heavily detailed public rooms is to be discouraged in co-operative apartment buildings because it is unnecessary.

The master rooms should be as large as possible. Developers sometimes find that the plan with the living room and dining room adjacent to each other, and facing the street, has preference over one in which these rooms are separated from each other. This type of plan, however, quite often means the installation of additional service elevators.

The incorporation of a wood burning fireplace in the living room of each apartment is, in the majority of instances, a selling asset and consideration should also be given to the building of fireplaces in the libraries and in at least one of the chambers for the higher priced apartments. These fireplaces should be built with individual flues and properly proportioned insofar as size of openings is concerned. Provision should be made for the storage of wood in the apartment.

The reception room, gallery or foyer to each apartment should be as large as the occasion permits as this room is the first feature to attract the prospects' attention.

The hallways and passages to the chambers should be as wide and as short as possible for convenience.

Access should be possible to the reception room or gallery from the kitchen or

servants' quarters without requiring that one go through the living room or dining room.

One chamber should be considerably larger than the others and it should have a large adjacent bathroom. The installation of a separate shower stall in this bathroom is worthy of consideration because of its popularity. The incorporation of at least one large dressing room adjacent to the largest chamber and its bathroom is a feature that is rapidly gaining favor in the larger apartments.

Two closets for each chamber is an essential feature in the higher priced apartments and one of these closets should be as large as possible if sales are to be made.

Bath rooms should adjoin each chamber as the trend seems to require as many bathrooms as one can afford. The bath tubs and lavatories should be of the wider and larger type.

There seems to be a tendency towards the reduction of the amount of tile work formerly used in the bath rooms of the most expensive type of apartments, leaving for the individual buyer the selection of his own colors and the amount of tile required. Each bathroom should be equipped with towel cases and medicine cabinets.

Most builders find that if the walls throughout are canvassed and given an attractive paint job that the requirements of the average buyer are fulfilled, although recently we find the use of wall paper for the chambers to be gaining in favor.

The selection of the type of floors to be used in the main rooms should be given consideration. The best type of oak flooring seems to fit most conditions, although cork tile, marble and other types

of flooring are adaptable under certain conditions. The floors of the service portion may be maple or cement for the installation of linoleum, rubber tile, et cetera. Ample linen storage space should be provided. Provision should also be made for the storage of the linen required by the service department.

The installation of cedar or other so-called mothproof closets seems to meet with present-day fancy.

The pantries should be large and equipped with broom closets, china and silver storage compartments. Silver sinks and storage vaults are quite often used in apartments of the more expensive type. Adjacent to each kitchen there should be a storage closet for equipment.

The kitchen entrance doors and service elevators should be as large as possible with the view of accommodating the installation of large pieces of furniture.

All kitchens should be mechanically ventilated.

As many public and private telephone extensions should be placed in each apartment as the problem demands.

High ceilings are becoming more popular in co-operative apartment buildings.

One of the most important features in the planning of co-operative apartment buildings is the absolute subordination of the exterior to the floor plan insofar as fenestration is concerned. This at first may seem a rather broad assertion but the correct location of windows to allow for proper room balance together with the important item of window draping provisions should be given first consideration.

The spacing of doors and windows to insure the installation of full width trim and to give proper clearances for decorative hangings is a point of utmost im-

portance. The placing of windows too near the corners of a room should be avoided for the same reason. In many buildings the interior decorator finds it almost impossible to solve his client's problems because of the fact that the architect gave but little thought to these most important features.

The location of doors and windows to allow for the proper placing of furniture is another point of prime importance.

The prevailing fashion requires that radiators be concealed in recesses under windows where possible. This allows a larger range for decorative treatment.

If the developer's selling program includes the furnishing of refrigerators and stoves, these items should be as large and well finished as possible, for one of the most essential points, insofar as its appeal to the woman buyer is concerned, is the provision of the best obtainable kitchen equipment. The refrigerators should have ample food storage capacity and be equipped with a mechanical refrigerating unit whose ice freezing capacity is abundant.

Refuse incinerators, if properly installed, are a very desirable feature. They should be located immediately outside the kitchen door if possible.

Servants' rooms in co-operative apartments should be larger than those in buildings of any other type.

In apartments requiring two or more servants' rooms it is good practice to incorporate in the plans a servants' dining room or hall.

Apartments of the most expensive type should be provided with individual laundries and storage rooms. These laundries and storage rooms are most often located in the basement or ground floor, although in some cases they are built on each floor adjacent to the apartments which they serve.

All windows should be as large as practical and the window sills as low as possible.

The arrangement of rooms should be flexible, for a building becomes more readily salable if rooms may be added to or deducted from the typical plan without undue sacrifices and costly structural and mechanical changes.

In apartments of the more expensive type the location of vertical plumbing and electrical risers is a point most worthy of consideration. If these risers are properly located, rooms and bath rooms may be shifted from one location to another without excessive expense being incurred.

The incorporation of sound resisting mediums is a most essential item in the construction of tenant owned apartment buildings.

It is impossible to provide too many electrical outlets in the form of base plugs, wall brackets, ceiling outlets, switches, et cetera, and because of the present day use of table lamps the switch-

ing of base outlets is an item worthy of consideration in the higher priced apartments.

Where the climate demands, the installation of weatherstripping and the caulking of window frames is a most important item.

In recent years the duplex type of apartment is meeting with a most favorable reception from the buying public. The feeling seems to be that an apartment with the living room, library, dining room, kitchen, and maid's quarters on the lower floor with the master chambers and bath rooms on the upper floor comes nearest to filling the requirements of the average buyer's conception of a home.

The present day zoning and building laws which permit and quite often require the use of set-backs, provide terraced areas and give the architect an opportunity to design buildings which have a tremendous selling advantage.

Garage facilities should be incorporated in co-operative apartment developments, if possible, with provision for at least one car per apartment.

It should be needless to say that too much thought cannot be given to the proper selection of the best types of standard equipment, machinery, et cetera. The proper selection of boilers, pumps, valves, elevator equipment, et cetera, will always assure low operating costs.

The architect should strive to impart a residential feeling in the designing of any co-operative apartment building, as this item is the most important one in the entire problem.

"CONTRACTOR'S CREED"

MAGNETIZES INTEREST

Col. Davis, a member of the Northwest Branch of the A. G. C., has utilized observations he has made during long experience in the construction industry by compiling a "contractor's creed." This creed, contrived in alphabetical arrangement, which appeared in the Northwest A. G. C. News, follows:

A—All men were born nearly equal, but they do not stay that way.

B—Be fair and just to your fellow men.

C—Calm yourself when things go wrong.

D—Do the job right regardless of all things.

E—Even when things go wrong read the four lines above.

F—Frankness is a fine thing, but a close mouth never has to retract.

G—Good work may be its own reward, but you cannot live without a profit.

H—Honesty is the best policy. Be sure that the other fellow is honest.

I—Income is something we must all have. Remember that when you bid.

J—Judge your fellow men by what they do, not by what they have.

K—Know the men you deal with, that's better than a credit rating.

L—Learn that this life is only temporary, there is another life beyond.

M—Money is one measure of man's success. There are other things to consider.

N—No one knows the future, but faith in the future will help us all.

O—Opinions on this subject are personal and vary greatly.

P—People in general agree that there is a future life.

Q—Questions on this subject have been argued in churches for many years.

R—Rest is said to be the true reward for honest toil. Should it be the only reward?

S—Sound principles always win out.

T—Thinking means progress. Contractors should think.

U—Unity means strength, therefore contractors should be united.

V—Value your friends, that they may value you.

W—Why are contractors such damn fools?

WHAT KIND OF PLASTER BASE?

BY ROGER STEWART

Good plastering obviously depends on three things: a firm structure, a good plaster base, and a good plaster. All are necessary, but of the three the plaster base is probably the most vital because without it the best plaster and the best structure will not stick together.

Although there are many plaster bases from which the builder may choose, all of them may be grouped into three simple classes. A discussion of these groups as a whole will perhaps indicate, more clearly than a discussion of the individual types, which kind of plaster base to use to secure the desired results.

The three groups may be called key types, suction types and reinforcing types. At once some one will say that metal lath, for example, is both a key type and a reinforcing type, and that scored clay tile holds plaster on both the cushion and the key principles and that consequently these classifications are not clearly defined. Be that as it may, these three divisions will serve efficiently to determine how each individual kind of lath or plaster base may best be chosen for any kind of plastering job.

Key Types

The first group includes all plaster bases in which the plaster is forced through holes or open spaces in its plastic condition in such a manner that when it sets it cannot be drawn back through these spaces. Wood lath is of the key type because the plaster is pushed through the spaces between the lath, where it spreads out and hardens to form a strong key made of plaster which must be broken away from the main body of plaster before the latter can fall away from the lath.

Metal lath of all types depends on this keying function to hold the plaster wall in place. All the wire fabrics fall into this classification for the same reason. Scored hollow tile is also a key type of plaster base because the ground coat is pressed into the dovetail grooves from which it cannot pull away.

What are the advantages and disadvantages of the key plaster bases, taking them as a whole rather than of any specific type?

In the first place, the strength of the ground coat plaster is what holds the scratch and finishing coats in place. This, of course, is ample for any condition if the plaster itself is properly made and applied. Good plaster will never break away from a key type base as long as the

base itself remains intact, until the plaster itself disintegrates.

On the other hand, all of the plaster that is pushed through to the back of the plaster base is wasted so far as its effect is concerned beyond the exact amount necessary to form a key with the lath or fabric. Under practical working conditions this waste may be excessive, for if the ground coat is too wet it will run down the back of the lath in large quantities, and if it is too dry it will drop off and be utterly useless.

A key type plaster base, which is used only as a means of holding the ground coat against the wall, does not theoretically have any ability to reinforce the plaster itself against minor cracks which may follow slight movements in the structure itself. In practice, however, most of the key type bases do act as a reinforcement to some degree.

This is particularly true of the small mesh wire fabrics and the ordinary types of metal lath.

Suction Types

The next group includes the whole range of "wall-boards"; that is, any material applied over the studs or furring strips which is in solid sheet form, without perforations from which the plaster can be keyed.

It includes many types of insulating board which are also designed for use as heat insulators, and all of the so-called plaster boards. This entire group holds the plaster by what may be broadly termed suction. It is the same way that glue takes hold in the fibres of wood. The wet plaster penetrates the tiny surface pores and forms innumerable microscopic fingers all over the surface of the wall-board.

When the wallboard is properly designed and the plaster is correctly made and applied, this suction or adhesive effect is amply strong to hold the customary weight of plaster on either walls or ceilings.

Let us again consider the advantages and disadvantages of wallboards as plaster bases. Obviously they do not waste any plaster because none is used for a key effect except the minute quantity that penetrates the surface pores or takes hold of the fibre ends on some types of wall-board.

These wallboards are quickly applied, covering large areas at a time and they form a flat, smooth surface that is closely parallel to the face of the finished plaster.

On the other side, it must be apparent that they rely for their holding properties chiefly upon the adhesion which the plaster has with the surface of the wallboard. If the wallboard absorbed moisture or if it disintegrated through any cause, these minute fingers would tend to let go and the plaster fall away. This rarely occurs, to be sure, but it is a condition that must be borne in mind when considering

plaster bases from a theoretical point of view.

A practical matter, however, arises in connection with the joints between sheets of wallboard. Practically all wallboards have considerable strength in themselves. They can be tested against all types of distortion and they rarely fail until they pull away from the nails that hold them to the studs.

Since the studs or furring strips themselves, being made of wood, are subject to some slight motion due to expansion and contraction when moist or dry, or due to movement in the building structure itself, these joints between plaster boards are the weakest points in the wall and may cause cracks to appear in the finished plaster unless special precautions are taken to avoid them by use of reinforcement.

The joints are also the trouble points with any type of wallboard that shrinks or swells with changes in humidity of the air or when water actually strikes it from a leaky roof or from condensation on water pipes.

To overcome this practical difficulty with wallboards, particularly those that are made in large sheets, it has now become customary to apply a strip of metal lath or wire fabric over the joints to add reinforcement to the plaster at these places. Some plasterers and many architects recommend the use of a reinforcing material of this type all over the surface of the wall when insulating boards are used, because they do not place sufficient reliance on adhesion or suction alone. When so used these materials fall into our third classification, reinforcing types.

Reinforcing Types

Before discussing them, however, it should be noted that plaster applied directly on common brick or gypsum blocks, on wood lath or on unscored and unglazed hollow tile also relies for its strength and holding power on this adhesive property of plaster.

The third group includes all types of plaster bases which are actually embedded in the heart of the plaster where they act like steel reinforcement in concrete structures. Any wall that is "back-plastered" makes the plaster base function as a reinforcement of a more or less perfect type.

Backplastering, however, is usually done more for the protection of the plaster base against fire or rusting than to give this reinforcing effect to the plaster wall. It has already been noted that metal lath and small wire mesh fabrics have a reinforcing effect if an excessive amount of plaster is run through the back of the lath and also if the job is back-plastered.

The true reinforcing types are somewhat different in character. They all use a wire fabric which is so arranged as to become thoroughly embedded in the heart

of the plaster by self-furring devices that hold the mesh slightly apart from the studs.

To accomplish this result they have a heavy backing of a strong material like high-grade building paper which functions in several ways. When the ground coat is applied over the fabric it presses the paper away from the wire a short distance and forces the plaster around the wires so that it completely embeds them, thus producing a monolithic, uniformly reinforced slab of plaster.

The backing presumably has some of the adhesive properties of a wallboard and helps to hold the wet plaster in place until it takes its initial set although it is not primarily designed for this purpose. It subsequently protects the back face of the plaster and probably adds some measure of heat insulating and sound deadening properties, although these have not yet been scientifically measured.

A reinforcing type of base holds the plaster securely to the wall or ceiling because the plaster itself would have to disintegrate entirely before it could fall away.

The steel takes up the tensile stresses that ordinarily cause cracks, if the structure is reasonably firm. This type of reinforcing base is usually applied in sheets, which are overlapped at the joints.

Wire fabric when applied on a wall or ceiling is subject to sagging unless tightly stretched between studs, ceiling beams or furring strips, unless the fabric itself is stiff like metal or wood lath or any of the common types of wallboard. If the fabric does sag in this manner, it requires more plaster to fill up the hollow spots than is normally necessary, and if there are bulges the plaster is too thin at these points to give a satisfactory result.

How Reinforcing Helps

This problem has been solved very recently by an ingeniously designed reinforcing base that consists of a welded wire fabric having a mesh about 2 inches square, to which is laced a heavy, tough and durable paper backing by means of a series of V-shaped stiffening bars running the length of the sheet.

These stiffeners make the reinforcing fabric more rigid and prevent any buckling, thus forming a straight clean surface that economizes on plaster like a wallboard and yet has all the advantages of a paper-backed plaster reinforcement. The stiffening bars can be bent to fit the material around or into corners. The sheets are of convenient size for the lather to handle and can be easily cut with ordinary metal shears.

What type of plaster base should be used? The question cannot be settled here because so many factors must be taken into consideration on each specific job. Decision must follow careful study.

American
Fire and Marine
Insurance
Company"*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

PHILADELPHIA

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

This College Is Waterproofed With "ANTI-HYDRO"

The concrete foundation walls and basement floors in the Music Building and many others comprising the North Carolina College for Women are waterproofed with "ANTI-HYDRO."

These Buildings were not all erected at the same time. But after once using "ANTI-HYDRO," results were so satisfactory that "ANTI-HYDRO" was used in all later buildings.

"ANTI-HYDRO" has so thoroughly and permanently waterproofed the concrete foundations that the rooms below grade are absolutely dry and usable at all times.

"ANTI-HYDRO" is dependable, economical and extremely easy to use. It is a liquid integral compound, which when added to the mixing water makes concrete permanently hard and waterproof in one operation.

Twenty-five years of continuous use have taken all the doubt out of "ANTI-HYDRO."

Results are guaranteed permanent. For satisfaction, for economy, for proved results use "ANTI-HYDRO" on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

Luzerne County, R-4, Sec. 7-A, Plymouth Township, 7,497 feet. One course reinforced concrete, 3,350 feet grading and drainage.

McKean County, A-5897, Eldred Township, 9,318 feet. One course reinforced concrete, 527 feet grading and drainage.

Northampton County, R-517, A3909-6733, Upper Mt. Bethel Township, Portland Borough, 9,153 feet. One course reinforced concrete.

Perry County, R-191, Tuscarora Township, 27,750 feet. Bituminous surface treated macadam surface course.

Crawford County, Vernon Township, R-82. Two-span reinforced concrete bridge, 30-foot span, 5-foot sidewalk pavement, one course reinforced concrete.

Fulton County, Belfast Township, Route 38, Sec. 3-A. Construction of 2-span reinforced concrete beam bridge, 45-foot span.

Washington County, Union and Carroll Townships, Route 247. Construction of two-span reinforced concrete beam bridge, 45-foot span, 7-foot roadway.

Owners taking bids due September 27th at 10 A. M.

Bedford County, R-119, Sec. R-2, Bedford Township, 5,708 feet. One course reinforced concrete, 500 feet grading and drainage.

Carbon County, R-163, Sec. 3, Lowe, Towamensing and Franklin Townships, Parryville Borough, 9,479 feet. One course reinforced concrete, 140 feet grading and drainage.

Centre County, R-404, Sec. 1, Ferguson and Patton, 31,009 feet. One course reinforced concrete.

Clearfield County, R-276, Sec. 3, Ramey Borough, Bigler Township, 10,184 feet. One course reinforced concrete.

Crawford County, R-294, Sec. 2, Wayne Township, 13,960 feet. One course reinforced concrete, 950 feet grading and drainage.

Indiana County, R-573, Sec. 1, A-6781, Banks Township, Glen Campbell Borough, 10,560 feet. One course reinforced concrete, 1,587 feet grading and drainage.

Lackawanna County, R-332-648, A-6302, Benton Township, 21,006 feet. One course reinforced concrete.

Montgomery County, R-198, Lower Moreland Township, 6,868 feet. One course reinforced concrete.

Northampton County, R-165, Sec. 4, Forks and Lower Mt. Bethel Township, 28,717 feet. One course reinforced concrete, 200 feet grading and drainage.

Schuylkill County, R-105, Rush and Kline

Townships, 1,527 feet. One course reinforced concrete.

Wayne County, R-171, Sec. 2, Lake and Cherry Ridge, 32,653 feet. One course reinforced concrete, 838 feet grading and drainage.

York County, R-332, Sec. B, Lower Windsor and Chanceford Townships, 17,300 feet. Grading and drainage.

Allegheny County, Patton Township, Route M-187, Sec. No. 2-C. Construction of 1-span reinforced concrete beam bridge.

Pennsylvania Contracts Awarded

Residence and Garage, Wayne, Pa. Contract awarded F. S. Hammon, Brookline, Pa. Architect, Harold Edw. Williams, Drexel Hill, Pa. Owner, F. B. Payne, care of Bell Telephone Co., 17th and Arch streets, Philadelphia, Pa. Stone, brick, 2½ stories, wood shingle roof, hardwood floors, electric light, tile work.

Bank (alts. and add.), York, Pa. Contract awarded to A. B. Seifert, 702 West Poplar street, York, Pa. Architect, J. A. Dempwolf, Cassatt Building, York, Pa. Owners, York Trust Company, J. Lewis, President, 21 East Market street, York, Pa. Brick, 3 stories, 68x63 feet, terrazzo and linoleum floors, electric light, elevator, metal window guards, bronze, ornamental iron work, granite, steel skylights, tile and marble work, terrazzo work, heating extension.

Road Work, Pennsylvania. Contracts awarded.

Juniata County, R-193, Beale and Milford Townships, Mifflin Borough. Bituminous surface macadam, one bridge. Lord & Quigley,

Millerstown, Pa., \$200,198.

Elk County, R-99, Spur, Jay Township. One course reinforced concrete. Joseph Wiesner & Son, St. Mary's, Pa., \$217,008.11.

Westmoreland County, R-302, Sec. 11, Cook. One course reinforced concrete. Matthews Brothers Construction Co., Dormont, Pa., \$194,457.

Potter County, R-236, Sec. 1, Sharon Township. One course reinforced concrete. Max E. Butler, Duke Centre, Pa., \$109,343.

Office Building, Eddystone, Pa. Contract awarded Wark & Co., 1600 Walnut st., Philadelphia. Architects, Simon & Simon, Fidelity-Philadelphia Trust Building, Philadelphia. Owners, General Steel Castings Co., R. P. Lamont, President; A. F. Bladgon, General Superintendent, Eddystone, Pa. Brick, reinforced concrete, granite, steel, 2 stories and basement, 176x47 feet, 47x84 feet, concrete roof deck, cement floors, hollow tile, safety treads, roof ventilators, metal weather strip, caulking, waterproofing and dampproofing, steam heat, electric light, metal lath, marble and terrazzo work, tin-covered and kalamein doors, bond, iron stairs, ornamental iron work, brass pipe, wrought iron pipe, floor hardener, excavation, limestone, gypsum block, dumb waiters, steel sash, steel basement, built-up roof, metal toilet partitions, steel shelving, composition floors, linoleum, painting, glazing, hardware, cork insulation, plumbing, kitchen equipment.

Inn (alts. and add.), Stores (2), Coatesville, Pa. Contract awarded Charles S. Ban- nett, 4700 Springfield ave., Phila. Architect, C. W. Brazier, Crozer Building, Chester, Pa. Owners, Coach and Four Inn, Stewart Huston, Coatesville, Pa. Brick, steel, general alterations and addition to present building, 4-story addition, 41x75 feet.

CONGRESS GROUP TO STUDY ELECTRIFICATION OF BUILDINGS

*John T. Windrim, Architect, Will Head
Industry Conference*

At the request of the electrical industry of Philadelphia the Building Congress is establishing the third of its industry conferences for an important branch of the building business—electrification. The purpose of the group will be to analyze the requirements for adequate servicing and wiring of all manner of buildings looking toward the establishment of recommendations for good local practice in this important part of the building field.

John T. Windrim, widely known architect, is the Chairman of the Conference Group now being formed for this purpose and George R. Conover, Managing Director of the Electric Club of Philadelphia, has been appointed Secretary to the Conference Group by the President of the Congress. The group will begin functioning shortly with a series of meetings to review the material already in hand relative to adequate wiring specifications for various types of buildings, including residential.

The various organizations which are collaborating in the selection of representative and interested persons to make up

the Conference Group are: Philadelphia Chapter, American Institute of Architects; Local Sections of American Institute of Electrical Engineers, and the Illuminating Engineering Society; The Electric Club, and the Building Superintendents' Association of this City. Representatives have also been appointed to the group by the President of the Congress.
H. J. B.

ARCHITECTURAL YEAR BOOK TO BE DEDICATED TO MILTON B. MEDARY

Announcement is made by the Joint Exhibition Board that the Year Book now in preparation by the American Institute of Architects, Philadelphia Chapter and the T-Square Club will be dedicated to the memory of Milton B. Medary. This will be the Thirty-Second Annual Edition of this Book which is published each year in connection with the Exhibition of Architecture, Landscape Architecture and Allied Arts. In addition to being profusely illustrated with examples of public, ecclesiastic, academic and domestic work to be shown in the Exhibition which will be held from November 1st to November 15th, in the Galleries of the Wanamaker Store—it will contain a monograph on the life and work of Mr. Medary, the distinguished architect who died at his home in Bala on August 7th.

D. KNICKERBACKER BOYD.

MAKE YOUR ENGLISH HOUSE RIGHT

*A Summary of Essentials That Will Save
Mistakes*

By K. S. KINGSLEY

Recently the so-called English style has come into its own in the small house field. It is deservedly popular because it has a very attractive and picturesque quality,

getting away from the "boxiness" of much small house design.

Along with the really good small English houses are naturally many imitations by those who do not understand the essential qualities of this most attractive style. Such designs may use quite legitimate features of English architecture but combine them in ugly ways and exaggerated forms. A few essentials of good design in this style make all the difference between success and failure.

In America, the term "English architecture" has come to mean a rather distinct style. This style that has been developed in America is derived from the cottages in all parts of England adapted to American conditions. Of course, the Georgian style is as truly English as the earlier periods of design which have more largely influenced the type of architecture we now term as "English."

One of the chief characteristics of the English style is its adaptability to the use of varied materials. The builders of the English cottages took the materials that were closest at hand and built the picturesque farm houses and town houses that have a characteristic charm.

In Southern England, they took the brick of the neighborhood, combined it with timber using brick to fill in between the heavy framing, forming what is termed "half-timber work." They used the clay tile for their roofs and on the vertical walls as shingles. In the Cotswold district, the houses were built of the native stone, that being the most available material, and the roofs were largely made of thin stone "shingles." Wood was not as plentiful in England as in America. For that reason, the wood was used largely for framing rather than as an exterior covering.

In the old half-timber work the timbers that showed were members of the actual structural frame of the exterior and it was really the skeleton of the building

showing through. That accounts for the use of the diagonals and the curved forms. The latter were sometimes caused by the use of the sound oak from the framing of boats and ships.

Honest Use of Materials

In designing half-timber work, it is well to have pictures of some of the old work to use as guides, and also to remember that the half-timber, or its present-day imitation, should recall actual structural members.

The chief thing to remember in building houses in the English style, is that its character is derived largely from the honest use of material. By that is meant that in the English work things should always be what they seem. Simple, direct use of materials is essential if successful English houses are to be the result.

The mass of the house should be determined by its plan, and it is the irregularity of the plan of the English house that gives it its picturesqueness because the roof lines are the natural outcome of framing the roof to cover the irregular plan. On a flat wall surface, it is a mistake to fake a gable-end running from the ridge to the second-floor line at the corner. Roof lines should be actual roof lines, not fake roof lines on a flat wall.

The walls may be of any material or combination of materials, but care should be taken to see that one material is dominant; that is, that there is more of it than of others.

It is a serious mistake to break up a stucco wall with pieces of field-stone or bricks stuck in where they really serve

no purpose. The tendency to try to gain picturesqueness by sticking on a few slabs of stone at corners and windows is a mistaken one. A good builder will make sure that this error does not occur in his houses. The materials must always be used in a logical way; there is no exception to this rule in the building of English houses.

Stucco, for instance, to appear at its best in this style, must not be forced in texture. The texture should be that which is naturally derived from the hand-work of the craftsman applying it. The roughness and the ridges that occur through the sweep of the plaster's arm over its surface gives a pleasant effect. Different effects are obtained by the varying motions of the trowel in a natural way on the surface. To force the texture by putting globs of stucco on and smoothing them off, as if they were stones, is always a mistake, as is any form of exaggeration.

The roof is one of the most interesting features of English design because of its irregularity and because of the large area that one sees. As a rule, the roof should have considerable pitch. With the original English work, this was necessitated by the heavy rainfalls and the fact that thatch was used for roofs in the early days. A thatched roof naturally needed a steep pitch in order to shed water.

Variation should be in the tone, shade and depth of color of the various shingles, and these will give all the variation and "vibration" needed. Don't make the mistake of having the roof appear like a patchwork quilt as this is never good taste.

The gable-ends of English roof are usually very easy to treat. The secret is to make them just as simple as possible.

The treatment at the eaves of the English roof is also the simplest. There are

no elaborately built-up cornices, and classic mouldings are not used.

The windows in the English houses, in olden days, were small, and in the modern adaptation the small size of the panes is retained although the window surface is increased by grouping these smaller sash together.

The majority of English houses have casement windows, and as they are manufactured today, they are entirely practical even in rigorous climates. They are available both in steel and wood, and many can be supplied with small panes of leaded glass which give a true English "flavor." However, the double-hung window can be used with properly proportioned panes.

The doors are simple and straightforward, as are all the details of the English house. The batten or plank type of door is most suitable, usually with a small leaded glass window.

Although porches were unknown in the old English cottages, they can be designed for our modern houses in perfect keeping with the style.

The chimney is one of its most telling features and it therefore needs careful study in its design. As a rule, the simpler, the better; but one must be careful of its proportions. It must not appear too thin and inconsequential. A simple brick or stucco chimney with terra cotta chimney pots is always good.

The English house needs no "dolling up." Its character is due to its simplicity and directness rather than to any ornamentation, for ornamentation as such is entirely lacking on the exterior; the actual structural features—the gables, chimney, windows, doors—make the design,—or break it.

OLD BUILDINGS MUST BE REMODELED TO MEET COMPETITION

That the horse is as old as his teeth has long been an accepted statement; a certain school of beauty experts have been most successful in teaching women that they are only as old as the line of neck and chin, and W. E. Malm, Cleveland, Ohio, told Realtors of the National Association of Real Estate Boards in convention at Boston that office and business buildings are only as old as their elevators. Malm advised real estate doctors to feel the elevator pulse of their patients—the to-be-remodeled building—in his address on "Modernization of Business Property," given before the Property Management Division of the National Association of Real Estate Boards.

The equine of the species has to accept fate; the female of the species is told that she needn't accept fate. Mr. Malm advised that the business building has a chance for rejuvenation dependent on the

character of its tenancy, its rental rates, its rentable area and the height of the building.

Malm admitted that not only must elevators be revamped, but that the outer and inner appearance of the office building must be brought up to the standards of the new elevators. However, the undertaking must be tempered at every turn by sound judgment. "As a matter of fact, the complexion of the second floor of a building has little effect upon prospective tenants," he said, "It is my opinion that only the exceptional building can show any justification for costly improvements embracing the entire facade of a structure, as shops command high rentals due primarily to the location, while office rates are determined by the excellence of both interior and exterior treatment of the building—the efficiency of the office plans and the regularity and quality of the building services, in addition to the location.

"It is in a community which has reached the saturation point in space absorption where remodeling is really profitable. Improvement is a matter which must extend beyond the limits of the property itself and must include betterments in transportation, traffic, noise control, sanitary conditions, building regulations and other elements which have a bearing on the character of a neighborhood or district. The problem of the old building has never been more acute than it is at present, and an answer to its solution never more urgent. This condition has not resulted from any inordinate accumulation of antique structures, but is the consequence of a high tide of national prosperity which brought with it in some communities an over-supply of structures, and, on recession, left the old structures stranded on the economic sands, facing the pressure of a new competition."

Malm believes that the present simple style of architecture which is gaining acceptance for the business building will present less of a problem to the one who will eventually wish to remodel these structures, now so new that many are as yet unable to countenance the simplicity of their lines. The modern structure is bound to be especially amenable to rehabilitation. It is a difficult problem to remodel a very ornate building and a simple matter to work over a plain one. The improvements must always be in accord with the existing structure. Making a shining example of the Victorian era pleasant to the tenant of 1929, and still preserving congruity in the design of the building is no child's task.

"In any interior rehabilitation program the decorative effect usually produces the greatest volume of comment from the public, as it is the most striking visual evidence that something has been done to the building," Mr. Malm concluded.

—Builder's Weekly.

GERMAN BRICKWORK THOUGH IT IS RADICAL BOWS TO NO SUPERIOR

Brick have long been a favorite exterior material in Germany and masonry there has likewise long been a fine art. Probably nowhere else in Europe have equally striking effects in brickwork been obtained. Nor has architecture blazed more radical trails. Residence construction has not felt this so much as has the commercial and industrial field. The old ideas rather strongly prevail still with the home, but some of the most striking examples of both architecture and brickwork effects are to be found in the commercial and industrial districts.

Probably the most interesting structure in Hamburg, from an architectural viewpoint, is the recently finished Chile Building, designed with a remarkable fidelity along the lines of a monster ship. It is an office building, and to intensify the realism the various decks are represented with outside promenades on which the employees may take a noon-day stroll without the necessity of descending to the streets. These promenades extend almost the entire length of the building, from the up-thrust, clean-cut prow to the stern.

Another structure that is worth the time of anyone who chances to visit Berlin is a candy factory with such intricately woven columns of brickwork, and such a mass pattern effect, that it would seem at first glance an impossibility of accomplishment. Yet the German master masons apparently found little of difficulty in its erection as it went up with almost incredible speed, considering the extremely involved character of the brickwork.

This penchant for odd and extravagant treatment has apparently fastened itself upon most of the leaders in present-day

German architecture. Municipal buildings reflect it, which is a rather sure sign that the public has developed a liking for it. It appears in most of the more recently built semi-public buildings, the commercial clubs, the technical schools, the medical clinic and hospital buildings, and newspaper offices. When the latter surrender it is about the last word.

Most of Germany's churches are old. They are substantial brick and stone structures, but brick seems to have been as great a favorite in other centuries as it is today. The older ones are artistic despite their Gothic severity but the later ones have in many instances succumbed to the newer influence. The extremes are not so pronounced but they are there, very artistic in treatment and decidedly interesting.

But in the homes not so much of the new idea is apparent. The German conception of the home is conservative. The old traditions hold. There is still an apparent fondness for simplicity and the ideals of a bygone age. High sloping roofs afford opportunity for many of the long highly esteemed dormer windows, and pudgy little chimneys that taper as they rise still are predominant. Tiles are almost universally used of the type we know generally as Dutch.

Patternwork and unusual treatment of the columns so prevalent in residence architecture are exceptionally well done. Window treatments usually are plainly but sometimes very elaborately handled and Flemish bond is mostly preferred, possibly for the reason that of all the various bonds this makes the strongest and most durable wall. It is the most expensive to lay but for all that the long-sighted German frugality recognizes its economy in the end and employs it almost exclusively.

American landscape gardeners might

well take an observation course in German outdoor masonry decoration. This is one field in which the mason again is supreme. The grounds of the detached suburban homes scattered about the larger cities are replete with unique and interesting examples of their art. Garden walls display an infinite variety of types. Mostly there is a wrought iron accompaniment that heightens the effects. Always the patternwork is unusual in design and strong in its appeal, something one long remembers.

Brick is the common material for garden walks. It is in very general use in the supporting walls of sunken gardens where there is an excellent opportunity for the mason again to display his artistry in the fashioning of odd treatments. Fountains are frequently of unusual design and execution, and the rustic bridges so dear to the American heart give way to picturesque masonry culverts that will last a century. All in all, Germany's masonry is in a class very much its own.

BLOWERS TO VENTILATE HOT TELEPHONE BOOTHS

Big Phone Companies Install Mechanical Ventilation in Small Stalls

List among public health improvements mechanical ventilation of telephone booths.

No longer will thousands of hapless human beings be compelled to swelter and sweat in the dinky little, air-starved stalls, according to the last word from the big telephone companies. These booths are to be individually ventilated by little blow-

er fans which change the air constantly even when the doors are closed tight. The first of these mechanically ventilated booths are to be installed in the huge Grand Terminal building in New York where thousands of phone calls come every day, it is announced.

Several efficient methods for ventilating these booths have been developed, but a Boston manufacturer has brought out one that enables the blower to drive in fresh air and carry out vitiated air without the slightest noise of a whirling motor. This system was successfully tested by the phone companies but officials decided not to put it in because they declared it would encourage long conversations over the telephone.

"Make conditions too comfortable in the booths and people will talk longer on the telephone," the phone officials said. "When people find air conditions in the booths not to their liking and sweat about it, they cut short their visits over the telephone."

But public sentiment, as usual, is winning. The phone companies are yielding. Like other big public utilities, they realize that service is the watchword of modern business and that the public must be served.

BUILDING CODES THAT ARE LOADED

During the last few months there has been a widespread effort to foist a "uniform" building code upon the cities of many states.

From a seemingly public spirited source, the building commissioners of the cities of a state, or two or more states, are invited to attend a conference, ostensibly

for the purpose of forming a state or group organization, but mainly for the purpose of formulating and adopting a uniform or "model" building code. At first thought this seems to be altogether altruistic and commendable.

Officers are elected in advance of any adoption of constitution or by-laws and the organization meeting is at once invited to select a code committee whose duty is to draft a uniform code.

At this time comes the offer of assistance from one or more engineers and self-styled "experts," who are always in attendance, and audibly so. The code of some other city is offered as a guide to the code committee's labors. The code of far-off Shreveport, La., seems to be the popular one; maybe because it was prepared with the acknowledged assistance of two engineers employed by a building material association.

The cupidity of this performance has not escaped the attention of all magazines devoted to honest construction practices, for the March 20th issue of *The American Architect* tosses a pregnant bombshell into this sorry mess.

"The makers of building codes," it says, "must first consider the community welfare as it appears in the insurance of safety and sanitation in building construction and the conservation of invested capital. This is always possible by permitting in use the maxima of the capabilities of materials limited only by recognized safe engineering practices. When this is done, a code is fair and just to all concerned."

"There is no material which is fit for universal application . . ."

"It is reprehensible, unfair and dishonest for any interest to legislate its competitors out of competitive existence, and yet this unethical practice is employed in some degree every day with the enactment of new or amended building codes. Such a condition results from ignorance and a supposed economy on the part of the communities."

"It is fair to assume that a service such as the preparation of a complete building code without cost is in reality a disservice and is intended to be such. Nothing of real value can be acquired without expense, and those approached with such a proposition should look askance at it. It is well to remember the admonition to beware of those bearing gifts—to conceal an ulterior motive—and also the fate of Troy and the wooden horse."

"There is a safe and logical way to prepare building codes. There are men of unquestioned ability and integrity—architects and engineers—who are competent to write a satisfactory code which will provide for the safety and sanitation of buildings . . ."

In other words, the *American Architect* advises that you decline to permit any

private material interest to write your code for you, no matter how much they camouflage the effort, but instead engage competent, honest and disinterested experts to do it, and pay them what it is worth.

Which is advice that we heartily indorse.

—*Building Economy.*

VENTILATING THE RESTAURANT

Ventilation is needed in almost every enclosure where people congregate. In the first class restaurants, however, ventilation is an absolute necessity and the quality of ventilation secured can have a very direct effect upon the success or failure of the business.

Guests will not patronize the hotel or restaurant dining room which is saturated with the odors of long dead meals. Fish, onions, cabbage and a myriad of other cooking odors are extremely distasteful to the nose of the average individual. As a matter of self-protection, the restaurant owner must provide adequate ventilation.

Five Points That Interest Restaurant Owners

The following five sales arguments are those that have proved most effective in interesting restaurant owners. Other arguments will suggest themselves in special local cases but the five below are universally applicable.

1. A ventilating fan installed in the kitchen keeps out of the dining room those odors from cooking foods which are so displeasing to patrons.

2. Properly installed ventilating fans will prevent the dining room from becoming hot and stuffy during the summer season, another dollars and cents reason.

3. A ventilating fan will remove greasy fumes before they have an opportunity to settle on walls, curtains, furniture and fixtures, causing them to appear old and dirty in a very short time. Restaurant owners appreciate the importance of keeping their places of business clean and attractive looking and proper ventilation is a most important aid in doing this.

4. A ventilating fan improves conditions in kitchens so tremendously that it is much easier to keep good help.

5. A properly installed ventilating system will do away with the objections of adjoining tenants to the odors and heat from the kitchen.

In calculating the type and size of equipment to use always bear in mind that a ventilating fan too small to handle a job properly is only an aggravation. Your reputation as a ventilation expert can be established only by using every effort to sell equipment large enough to give good results.

The air in a restaurant kitchen should

be changed once every two or three minutes and in the dining room once every five to fifteen minutes.

AMERICAN ARCHITECTURE

Time was when Europe regarded the American architect with more or less derision. He was looked upon as a novice on the hunt for ideas, and was not to be considered seriously. It is no longer so.

Today Europe concedes America an architecture distinctly her own. Instead of running to extravagant creations in the fields so long peculiarly European, palaces, cathedrals and state buildings, it is of a more prosaic type, commercial and apartment.

American cities have far outstripped their European contemporaries in development and growth. American architects, in consequence, have been meeting and solving most of the modern structural problems. They have perfected a type of building Europe is copying.

London's most popular commercial districts bear an American imprint. Paris' newest apartments are fashioned along American lines. Germany and Holland are injecting American ideas into their ultra-radical apartment designs. American ideas have arrived.

Recently Russia has arranged with a New York construction company for a \$25,000,000 housing development in Moscow. And across the Pacific Tokyo fairly shouts the pre-eminence of American skill in the architectural field.

American architects may spend their vacations in Europe and pick up here and there a useful idea, but usually they straightaway Americanize and improve upon it and send it back under a new guise.

—*Building Economy.*

APPEARANCE COUNTS NOW IN PLASTERING

The old methods of throwing plaster on a wall or ceiling without the proper care and attention have given way to modern and well-defined systems that have resulted in a splendid accomplishment.

Plastering is to the home or business building what clothes are to humanity. Appearance counts, always and in everything, and people are becoming interested in improving their ways of living.

Better plastering by a recent decorative method can be done only through the use of the proper products, and among these some stand as the highest representatives in this class. One is an emulsion based on Portland cement, sand and asbestos. To say that splendid results have been obtained with this decorative plastering would be to put it mildly.

Leading builders and decorators make it a point to insist upon the best as the only logical product that can be employed

efficiently. Beauty as well as permanent improvement have been made possible with the use of this material and it is highly recommended to all those who know of the importance of better plastering to use such splendid material as one that will give everlasting satisfaction.

—*East Bay Builder.*

VENTILATING THE THEATRE

This field is most extensive, as ventilation is vital wherever people assemble in large numbers.

In most states the laws require the use of mechanical ventilation in places of this nature. The field offers an excellent opportunity for the contractor to obtain a great volume of profitable business.

This field includes theatres, auditoriums, churches, lodge rooms, dance halls, club rooms, court rooms, billiard rooms, bowling alleys, gymnasiums, etc. Each of these buildings requires a little different ventilating application, but they can all be handled by the same general rules.

A ventilating fan in the theatre is installed to provide for the comfort and the health of the patrons, but in so doing it increases the profits of the theatre owner. This is especially true in the summer time when such places as theatres, dance halls, etc., are poorly patronized on account of the stifling atmosphere in these places unless they are properly ventilated. A ventilated system properly installed will almost double the summer attendance in motion picture theatres.

Ventilation in these buildings is primarily a question of removing heat caused by crowds and dead air which is being breathed over and over. In order to accomplish this result it is necessary to watch closely the path of the air through the room ventilated.

To obtain thorough ventilation, the location of the point where the air enters the room is as important as the location of the fan. The air from the point of entrance to the fan should pass over the entire area of the room in order to sweep along with it the dead stale air and carry it to the fan.

In most of the ventilating work on these classes the Ventura Fan can be used and installed in skylights, walls or windows as is most suitable. In toilets, small cloak rooms, lavatories, locker rooms, or other isolated rooms, the Sirocco Fan with duct system should be used.

It is desirable to always install two or more fans on each job in order that one-half the system for instance can be used in the winter time when the question of removing heat is not present. If three fans are installed in a motion picture theatre, large enough to take care of the bad summer conditions, either one or two fans can be operated at other times when the weather is milder.

For the ventilation of crowded rooms under summer conditions, figure 40 cubic feet of air per minute per person in the room in the more temperate states and 60 cubic feet per minute per person in the southern or warmer states.

From this it will be seen that the determination of the size of fan to use is very simple. Simply multiply the number of people in the room by 40 or 60 which gives the C. F. M. capacity of the fan required. Pick the fan from the price book which will give this rating.

The location of the fan is the next important step. Fans should be placed eight feet above the floor if convenient, but it is not important that they be placed at any particular height as long as the path of the air through the room passes directly over the occupants. When there is smoking in the room the fan should be installed as high as possible.

In the small and medium sized motion picture theatre, an ideal location for the fan is back of the stage. This arrangement assures that the doors are in the opposite end. All side openings are kept closed and the air is given a straight sweep the entire length of the building.

CONSTRUCTION'S PROSPECTS FOR THE FUTURE

Because important construction has been so rationally developed; because it is both the forerunner and the result of industrial, commercial, scientific and mechanical progress, and because it functions only on a basis of actual and definite conditions, it is not difficult, after reviewing the manner and progress of past developments, to consider governing principles of the future, and forecast with considerable confidence the directions and many of the objects, as well as some of the specific features of future progress, indicated to the discerning equally by the reflections of the past, and by the shadows cast by coming events. Thus we may confidently expect along the present line:

Centralization and distribution of power, labor and equipment.

Greater standardization of labor and equipment.

Greater development of natural resources of all kinds.

More skill, accuracy and better details in the forecasting and planning of production operations.

Greater and more accessible resources of research, records and service for construction.

Closer and fairer affiliation of capital and labor.

More frank and mutually satisfactory and profitable relations between contractors and dealers.

A broader and more universal system of ethics.

New types of construction for new demands.

New types of constructions for the opportunities afforded by new and improved materials, like high alloy steel.

New equipment developed for new methods of construction.

New and improved relations between construction, municipal and federal interests.

Wider foreign fields.

—Associated Contractor.

STOCK BROKERS ADVERTISE BETTER AIR CONDITIONS

Exchanges Act to Encourage Improved Ventilation of Board Rooms

Despite hectic days in the stock market recently, the air in all brokerage offices is to be cleared for the health protection of traders, according to officials of the stock exchange.

The attention of the New York Stock Exchange, the New York Curb Association and the Chicago Board of Trade has been directed to the "slothful" air conditions prevailing in the board rooms of many brokerage offices and these institutions are bulletining members asking that steps be taken to improve air conditions.

The result is that brokerage houses here and in other cities are installing exhaust or ventilating fans in their board rooms to pull out smoke and odors and bring in fresh air supplies at regular intervals. Some firms, like the theatres, are advertising the fact that the air in their board rooms is changed every three to five minutes.

The New York Stock Exchange recently installed a complete, modern ventilating system, which not only changes the air every three minutes with mechanical precision, but overcomes all odors. Smoke from thousands of cigars and cigarettes is not noticeable on the busy floor of the stock exchange.

The New York Federal Reserve Bank, the Morgan building and the First National Bank are reputed to have among the finest ventilating systems in the metropolis. Each office in the Federal Reserve Bank has individual control of the mechanical ventilation system.

SOUTH SEEKS TOURISTS THRU COMFORT CAMPAIGN

Toots Air Cooling and Ventilation of Buildings to Attract Summer Traffic Stream

Progressive commercial interests in the "solid" south this summer are turning to the comforts of air-cooling and air conditioning to attract a larger portion of the great American tourist stream which is pouring forth to all points of the compass on the biggest scale ever known.

Hotels, restaurants, theatres, banks and other public buildings in such cities as Atlanta, Memphis, Louisville, Hou-

ston, Ft. Worth, Birmingham, New Orleans and many other points, have installed elaborate air-cooling and ventilating systems for the comfort of tourists and are using various methods to direct this fact to the attention of those who seek the open road for their summer vacation.

In many places where excessive humidity often makes the heat unbearable, resorts making a play for the tourist patronage are advertising the fact that they have installed central systems of controlled ventilation which remove the moisture and supply the cooling breezes of the upper Great Lakes Region. Several important southern newspapers, in commenting editorially on the widespread adoption of air-cooling and mechanical ventilation in the south, point to the number of heat victims in the New England and other northern states as pretty good proof that the vaunted temperatures of the south are not so bad after all.

"Incidentally," remarks one newspaper, below the Mason-Dixon line, "if it gets too hot to be endured with patience in Massachusetts this summer, a trip to Florida could be recommended, and no doubt this will be tried by an increased number of excursionists and vacationists."

The movement for greater comfort in the summer through control of air conditions has received official recognition in Washington through the efforts of Major S. M. Corbett of the Army Medical Corps who is taking aggressive steps to bring about efficient cooling and ventilation of all government buildings. The muggy, sticky air in Washington during the hot season is pretty well known.

From the middlewest and far west it is reported that autoists this year are tending less to patronize the automobile camps and to seek comfortable hotels and farm houses. Farmers are finding the lodging of autoists a much more lucrative sideline and the tourists now on the road report an astonishing improvement in farm house accommodations with better cooking, linen sheets and other comforts and embellishments unheard of a few years ago.

Authorities everywhere are beginning to realize more than ever the necessity of speeding up traffic to reduce congestion. For that reason minimum speed laws are being adopted and police work on the highways is bitterly attacking the slow driver who chooses to take his time on important highways at 5, 10 or 15 miles an hour. No longer does the motorist get a warning admonition about speed. On the contrary, he is more apt to get a sharp command to "keep that old trap moving." One candidate for mayor in Toledo, for example, is featuring a plank in his campaign platform which commits him, if elected, to speeding up of traffic through a minimum speed ordinance and a greater elimination of left hand turns on important streets.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

PHILADELPHIA

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

When Better Floors Are Laid
"ANTI-HYDRO" Will Harden Them

Buick Uses "ANTI-HYDRO"

The concrete floors in this Buick Building are hardened, water-proofed and oilproofed with "ANTI-HYDRO." They cannot rut, leak or deteriorate, because "ANTI-HYDRO" results are permanent.

The severe conditions prevailing in garages quickly ruin concrete floors. Garages consisting of more than one story need absolutely waterproof floors to protect cars on floors below. By hardening and waterproofing concrete with "ANTI-HYDRO" you produce a floor that will last for years—without repairs and maintenance costs.

In one operation and at one low cost "ANTI-HYDRO" makes concrete impervious to water, oil and wear. It is an easy-to-use liquid integral compound, which is simply added to the water used to wet down the concrete mix. In addition to protecting concrete, "ANTI-HYDRO" increases its strength and makes floors, sidewalks, runways, ramps, roads, etc., ready for use in 24 hours.

"ANTI-HYDRO" has been in continuous use for 25 years. Satisfactory results are guaranteed. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Stables, Concord, N. H. Architect taking bids due Sept. 25th. Architect, Charles Z. Klauder, 1529 Walnut street, Philadelphia. Owner, St. Paul's School, Concord, N. H. Brick, stone.

Proposal

Sealed and separate bids or proposals will be received by the Board of School Directors of the School District of the City of York, Pennsylvania, for the erection of an East End Junior High School on the plot of ground located in Elmwood, Spring Garden Township, York County, Pennsylvania, bounded as follows: on the north by Fourth Avenue, on the south by Fifth Avenue, on the east by Ogontz Street, on the west by the city line, which is also Hill Street. The proposals must be submitted separately for the general construction of the building, plumbing and drainage, electrical work and heating and ventilating, all in accordance with plans, drawings and specifications prepared by Robert A. Stair, Registered Architect, Guardian Trust Building, 100 East Market Street, York, Pennsylvania; also proposals for grading the site and construction of the sanitary sewer and a storm water sewer. A certified check equal to 5% or an acceptable Surety Company bond equal to 10% of the aggregate amount of the bid must accompany each proposal to guarantee acceptance of the contract if awarded.

An acceptable Surety Company bond equal to the full amount of the contract will be required of the successful bidders. An additional bond of an acceptable Surety Company will be required in accordance with the Act of Assembly of the Commonwealth of Pennsylvania approved May 6, 1925, P. L. 546, being Act No. 292 of said year, as amended by the Act of Assembly approved March 28, 1929, being Act No. 114, for the purpose of providing for the payment of all labor and material entering into the said improvements and all machinery used on such improvement.

PHILADELPHIA ARCHITECTS HONORED BY APPOINTMENTS

American Institute of Architects Announces Personnel of Important Committees

The Annuary of the American Institute of Architects just off the press shows that singular recognition has been given to the abilities of Philadelphia architects. In preparation for the fall activities just opening on a national scale, the various Committees of the Institute will begin to function. Rendering service on many of these Committees will be found the following Philadelphians who have been selected for this work by President C. Herick Hammond of Chicago and whose appointments have been confirmed by the Board of Directors of the Institute.

On the Standing Committees:

Allied Arts—Charles L. Borie, Jr.
Building—Horace Wells Sellers.

Education—C. C. Zantzinger, who has also been appointed as Chairman of the Sub-Committee on Architectural Education.

Public Information—for the three year term, D. Knickerbacker Boyd.

Practice—George I. Lovatt.

Structural Service Department—C. L. Borie, Jr.

On the Special Committees:

Historic Monuments and Natural Resources—Horace W. Sellers.

National Capital—John Hall Rankin.

Foreign Relations—Frank R. Watson.

Sub-Committee on Exhibitions—W. L. Plack.

Industrial Relations—John Irwin. Bright.

Constitution and By-Laws—George I. Lovatt.

Honor Awards—John P. B. Sinkler.

Hospital Exhibition—H. Bartol Register.

These committees are independent of the several Committees of the Philadelphia Chapter of the Institute which have been functioning all summer and whose activities will be expanded during this month to tie up with many civic as well as architectural matters.

Skyscrapers 2000 feet or 2-5 of a mile in height are structurally possible, although the economic height is much less, according to a study just completed for the American Institute of Steel Construction. This study of building height has been in progress for the past two years under the direction of W. C. Clark, Chief Economist and Vice President of S. W. Straus & Co. It was made for the Institute by independent research for the purpose of providing unbiased proof that tall buildings in congested centers are economically advisable. The report found that buildings of 75 stories in height are not only economical but under certain conditions will return more on the investment than a building of 50 stories or 30 stories in height.

These conclusions were based upon investigations made upon specific plans for various buildings of varied height drawn by J. L. Kingston, architect of the staff of Warren & Wetmore. In making the studies the cooperation of numerous experts was enlisted, such as Stephen F. Voorhees of Voorhees, Gmelin & Walker; R. H. Shreve of Shreve & Lamb; David Lindquist, Chief Engineer of the Otis Elevator Co.; S. F. Holtzman and David C. Coyle of Gunvald-Aus, Consulting Engineers; Levering & Garrigues and McClintic-Marshall, steel fabricators; Otto Goldschmidt, Consulting Engineer and expert on mechanical equipment; Hatzel & Buehler, electrical contractors; W. G. Cornell Co., plumbing, and in the building managers and rental field such experts as Lee Thompson Smith, Clarence T. Coley and William C. Demorest.

The problem which this investigation attempted to solve has been outlined in the final report in the following words:

"Probably no question before the public today is of more interest and importance to the dwellers in our American cities than the current controversy over the regulation and limitation of building height. Certainly it is difficult to think of any public issue whose decision, whether in the one direction or the other, is likely to exert so important an influence upon

so many phases of the average urban dweller's daily life. For the skyscraper controversy raises the whole problem of the physical structure of our cities. The efficiency of that structure will be reflected in the citizen's pocketbook through its effect on rents, incomes and taxes; its character will go far to determine where and under what conditions he lives and works, his goings and his comings, his expenditure of time and even to a large extent his social relationships. Broad questions of public health and safety may also be involved. If the daily round of life is so largely dependent upon the correct answer to this problem of city structure, it is imperative that the average citizen should be given the facts which will enable him to reach an intelligent conclusion upon the points at issue.

"Few public questions are now being debated with more heat and more persistence. At the one extreme we have a group of critics, chiefly city planners of the more doctrinaire type, who are bitter and extravagant in their criticism of the skyscraper, who find in it the source of most of the evils in our city life and who advocate a definite restriction of building height to a maximum of eight or ten stories. At the other extreme is a school of protagonists who are enthusiastic and even lyrical in their praise of the skyscraper, who see in it both a necessary result of American conditions and a characteristic product of American genius, and who protest against any attempt to restrict or regulate its development. Ranging between these two extremes are individual thinkers who are willing to see both sides of the question, who appraise pros and cons on the basis of their individual experience or such facts as happen to be available to them, and who favor moderate programs of restriction or regulation based on their individual appraisals of merits and defects. As usual, however, it is the extremists who are most vocal and, in the face of their vague generalities and conflicting claims, the average citizen stands confused and confounded.

"It will be enlightening to recall at the start that this public controversy over the skyscraper is by no means a new phenomenon; with more or less vehemence it has raged almost continually since the completion of the Tacoma Building in the city of Chicago about forty years ago ushered in the era of the skeleton steel frame building which is the true skyscraper. But an examination of the literature of the subject reveals an interesting story of how the battle front has shifted from time to time. In the early days, the attack was directed chiefly against the strange and unsightly character of these tradition-breaking 'monstrosities' which dared to raise their heads to the dizzy height of 12 or 16 stories, against the way in which they 'disfigured'

the streets and against the possibilities of catastrophe involved in 'the collapsing of one of these monster structures on a crowded street.' In these attacks one recognizes, in part at least, the eternal prejudice against 'the new,' the same prejudice which a little over a century ago led the English farmer to fight the introduction of the iron plow with all sorts of dire, fantastic prophecies and less than a century ago caused the doctors of a leading German city to prepare a weighty professional protest against the proposal to bring the railroad to their city on the ground of the danger to the health not only of those who dared to ride in the new fangled device but also of those unfortunate citizens who could hardly escape injury to health from observing the trains as they raced through the countryside at the fantastic speed of 20 miles an hour. Later on in the attack on the tall building, as the civic consciousness became more sensitive to the slum problem, the critics increasingly emphasized the shutting off of light and air and the consequent unfavorable effect upon public health. In the last few years, with traffic conditions becoming almost intolerable in our leading cities, the skyscraper has proved a plausible scapegoat for this particular evil, and the 'congestion' argument has consequently become the chief stock-in-trade of the conscientious objectors to tall buildings *per se*.

"But while in the public mind today the strongest count in the indictment of the skyscraper is probably its alleged influence in increasing traffic and population congestion, there is another argument which demands prior consideration for reasons to be discussed later. This is the contention that the tall building is an economic fallacy,—that even from the private owner's point of view it does not 'pay' and therefore should not be per-

mitted. Now the solicitude of the critic for the poor building owner who foolishly insists on putting his money into unprofitable investments is somewhat amusing and hardly consistent with the claim that the latter is a robber of values that rightfully belong to others, that he who is allowed to build a tall building is given an economic advantage which should be compensated for by heavier taxation, etc. However, if we are willing to overlook such patent inconsistencies, we will recognize in this 'economic fallacy' argument an ingenious flank attack upon the position of the skyscraper enthusiast.

"Indeed, if this one point could be proved, the whole battle against the skyscraper would be won. Obviously, if it can be conclusively demonstrated that tall buildings as a class are unprofitable or less profitable than low buildings, investors will cease to erect such structures and legislators will not hesitate to discourage them. If the tall building *per se* involves the sacrifice of private rights, the courts will be apt to interpret the police power for zoning purposes much more liberally than otherwise. Arguments based on 'light and air' protection, 'fire hazard' or 'traffic congestion' will be largely works of supererogation. On the other hand, if the tall building is found to be the most economical development of the central business sites of our leading cities, private owners will strenuously oppose any drastic confiscation of their property values and public opinion, the legislatures and the courts will back them up, except to the extent that a sound and reasonable exercise of the police power may require regulation in the obvious interest of public safety, health and morals. In other words, economic considerations will be the determining factor in this as in other fields of human progress. Society is willing to submit to reasonable regulation to

reduce as much as possible the wastes and pains of progress; it is unwilling to see progress in a given direction blocked altogether."

Assuming that the land value is \$200 per square foot the investigation showed that a building of 63 stories in height reaches the point of maximum economic returns. From a detail investigation of an 8-story building costing \$22,193,000 to build the net return was found to be but 4.22%. In other words the higher land value makes such a low building unprofitable. The return on a 63-story building was found to be 10.25%. Where the land value is \$400 a square foot a building of 75 stories in height was found to be most economical. These conclusions were reached upon the supposition that the construction of the building would be restricted by the zoning laws of New York City applying to the mid-city sections.

The report notes:

"This maximum *economic* height is of course much below what might be called the maximum *physical* or *engineering* height. For all practical purposes, this physical or engineering limitation upon possible building heights has been removed by the flexibility of structural steel, terra cotta and other modern building materials and by the astounding developments in elevator and foundation engineering. Competent students of the problem estimate that if it were not for economic factors, it would be possible to erect, and operate successfully, an office building approximately two thousand feet in height. The adequate elevator servicing of such a structure would require an elevator speed beyond the present legal limits as well as new safety devices and ingenious traffic arrangements (such for instance,

as doubledeck cabs and new combinations of express and local cars) which have not yet been subjected to the test of actual public trial but which, on the basis of prolonged experiment, the foremost elevator engineers believe to be entirely practicable. The two limiting factors which make it impracticable to go beyond the approximate height of 2000 feet are (1) the enormous weight of the elevator cables required, and (2) the capacity of the *average* human ear drum to withstand the vibration in an elevator cab travelling at a speed exceeding approximately 1500 feet per minute."

A study of the economic possibilities requires the careful consideration of various factors which enter into the physical construction, the rental outlook and the restriction laws surrounding skyscrapers. Among the important factors noted in the investigation were the following:

1. Value of the land
2. Size and shape of plot
3. Legal restrictions
4. Efficiency of architectural design and layout
5. Building factors showing tendency to increase in cost as height is increased
 - (1) Structural steel
 - (2) Elevators
 - (3) Brickwork
 - (4) Plumbing and water supply
 - (5) Heating and ventilating
 - (6) Electric light and power wiring
 - (7) Total mechanical equipment
 - (8) Permanent interior partitions
 - (9) Windows and glazing
6. Building factors showing tendency to decrease in cost as height is increased
 - (1) Roofing
 - (2) Excavations and foundations
 - (3) Miscellaneous

7. Building factors showing tendency to constant cost of all heights

- (1) Interior finish
- (2) Concrete floors
- (3) Exterior finish

8. Absorption of rentable area by elevators and other service facilities

9. Level of construction costs

10. Variations in rental value of floors at various heights

11. Variations in operating costs at various heights

The full report of the investigation will be published by the American Institute of Steel Construction in book form within a few weeks. This will include the details of the studies made together with all the tables of calculations proving the results. The work was monumental in its conception and has required a little more than two years for its completion.

It is felt that the effort has been well spent because this report will finally put to rest the innumerable incorrect statements which have been circulated regarding the economics of skyscrapers.

ADVISORY COUNCIL FOR FARM BUILDINGS MEETS

Hopes Structures Can Be Standardized with Result of Cheaper Production and Better Marketing

The Advisory Council of the Farm Structures Research Survey appointed by Secretary Arthur M. Hyde of the United States Department of Agriculture, to work in cooperation with Henry Giese, agricultural engineer of the Bureau of Public Roads of the Department of Agriculture and director of the survey, held its first meeting on August 27 in Washington and adopted a program prepared by Mr. Giese. The council consists of representatives of trade and agricultural organizations and departments and bureaus of the Federal Government interested in farm structures. The survey is being made upon the request of the American Society of Agricultural Engineers.

The program contemplates a study of the present status of research as it pertains to farm structures, and a study of a report of existing conditions together with a plan for stimulation and coordination of research investigations. The director will make contacts with agricultural and engineering colleges, with State Departments of Agriculture, with specialists in the Federal Government, and with industrial organizations and trade associations, in an effort to obtain any research data they may have as a result of studies of the subject. From the information obtained the director will make a report to the council and the report will be published.

It developed in the meeting that manufacturers are handicapped by lack of information on fundamental requirements

of farm structures. From existing data, which is largely accumulated opinion without scientific basis, it is difficult to obtain actual facts. Farm buildings recommended by various State authorities vary so widely as to type that manufacturers are at a loss to know how to meet the requirements. It is thought that if some measure of standardization can be brought about, at least within sections of the country subject to the same climatic and other conditions, the manufacturer's problems would be greatly simplified and the cost to the farmer reduced.

Structures represent the largest single item of investment the farmer has aside from his land; in the United States they represent some \$11,750,000,000. Apart from the features of beauty and harmony in buildings, the suitability of farm structures to their uses is closely related to agricultural economic welfare. From studies already made it has been found that milk flow is affected by barn temperatures, that egg production depends largely upon the comfort of the fowl, that the kind of storage affects the market grade of corn and small grains and hence affects the returns received by the farmer, and that good storage is an important factor in the order and therefore profitable marketing of horticultural products.

Through intelligent planning of buildings for housing agricultural commodities and for giving good care to animals and fowl, the advisory council hopes that as a result of the survey the cost of building construction may be reduced and the value of stored products increased, thus contributing to a lowering of the costs of production and placing farm products on the markets.

Members of the council attending the meeting were: W. G. Kaiser, president, and J. L. Strahan, of the American Society of Agricultural Engineers, Mr. Kaiser also representing the Portland Cement Association and Mr. Strahan the National Association of Farm Equipment Manufacturers; J. W. McBurney, of the Common Brick Manufacturers' Association of America and research associate, U. S. Bureau of Standards; Mrs. Margaret

Robinson, of the National Grange; F. P. Cartwright, chief engineer, and J. P. Quinlan of the National Lumber Manufacturers' Association; Stanley A. Knisely, director of research, sheet metal trade extension committee of the National Association of Flat Rolled Steel Manufacturers; S. H. McCrory, chief, and M. C. Betts, senior architect, and Mr. Giese, engineer, of the division of agricultural engineering, Bureau of Public Roads, U. S. Department of Agriculture.

The full membership of the council represents the American Farm Bureau Federation; the American Society of Agricultural Engineers; the National Lumber Manufacturers Association; the Portland Cement Association; the sheet steel trade extension committee of the National Association of Flat Rolled Steel Manufacturers; the Common Brick Manufacturers' Association; the Farmers' Educational and Cooperative Union of America; the National Association of Farm Equipment Manufacturers; the National Grange; the Structural Clay Tile Association; and departments and bureaus of the Federal Government.

The great national importance of heating and ventilating to modern life and the absolute dependability of every character of building upon these two industries will be emphasized at the First International Heating and Ventilating Exposition to be held in the Commercial Museum, Philadelphia.

While it is a matter seldom given more than a passing thought, buildings without heat and ventilation would be useless.

It was with this thought and the desire to demonstrate to the world the marvelous evolution in scientific thermal advancement made in recent years that prompted the American Society of Heating and Ventilating Engineers to hold an exposition during the period of the society's 36th annual meeting in Philadelphia, January 27th to 31st next.

These men of science who have passed through the trying years from the introduction of vacuum and vapor heating and air conditioning to the development of the

unit heater, the unit ventilator and light weight non-ferrous heating surfaces, are anxious to present in exhibition form the pioneering and present day record of the industry's activities and progress.

Electrical interests are experimenting in the field of house heating; room cooling units are an accomplished fact; panel heating is about to be given a trial; oil and gas interests are vieing with each other to improve their status and in the coal fields rapid strides are being made to simplify heating operation and reduce costs.

All of these interests will be represented at the Heating and Ventilating Exposition and all of these subjects will bring to the show exhibits beneficial alike to heating and ventilating engineers, architects, contractors, building owners and managers, home owners, builders and those allied with the building industry.

Products which will be shown, as indicated by space already reserved, include every type used in heating and ventilating; the boilers and furnaces in which combustion is performed, equipment using air, water or other heated fluids for the transfer of heat systems used to distribute the heat and the radiators for diffusing it to create comfort for human, animal and plant.

This range of equipment will include that which is used in the individual home as well as in the industrial plant.

In this scheme of things there fits in a great complexity of apparatus, equipment, instruments, devices and products:

Refractories, insulating materials, blowers, fans, air conditioning and humidifying equipment, pipe and piping systems, pipe fittings, unit heaters and all the control and regulating apparatus and instruments used at any stage in the generation of heat, cooling and ventilating.

This list contains only a limited idea of the types of equipment to be shown and does not include any of the supplemental or auxiliary material and apparatus.

Thus it will be seen that from the great diversified field to be covered, the heating and ventilating exposition should have a nation-wide appeal, interesting, in-

structive and beneficial.

President Thornton Lewis of the American Society of Heating and Ventilating Engineers has announced the following exposition committees: Advisory committee: H. P. Gant, chairman, York Heating and Ventilating Corp.; A. S. Armagnac, Heating and Ventilating Magazine; D. S. Boyden, Edison Electric Illuminating Co., Boston; W. H. Carrier, Carrier Engineering Corp.; A. C. Edgar, Certified Heating Assn., Inc.; Roswell Farnham, Buffalo Forge Co.; C. V. Haynes, Hoffman Specialty Co.; E. B. Langenberg, Langenberg Mfg. Co.; J. I. Lyle, Carrier Engineering Corp.; F. J. McIntire, United States Radiator Corp.; H. C. Murphy, Reed Air Filter Co.; F. R. Still, American Blower Co.; E. K. Webster, Warren Webster Co., and H. L. Whitelaw, American Gas Products Co.

Co-operating committee: O. H. Fogg, President, American Gas Assn.; C. H. Hammond, President, American Institute of Architects; E. M. Fleischman, President, American Oil Burner Assn.; A. J. Wood, President, American Society of Refrigerating Engineers; Walter Klie, President, Heating and Piping Contractors National Assn.; H. T. Richardson, President, National Boiler and Radiator Mfg. Assn.; John W. Meyer, President, National District Heating Assn.; W. C. Hanson, President, National Pipe and Supplies Assn.; C. E. Hall, Director, National Warm Air Heating Assn.; and R. T. Creviston, Manager, Plumbing and Heating Industries Bureau.

Charles F. Roth, with offices in Grand Central Palace, New York City, is manager of the exposition.

CUBIC CONTENTS OF BUILDINGS

Discussion of methods of cubing the contents of buildings arises occasionally and a variety of opinions have been expressed at different times. The latest method approved by the American Institute of Architects is set forth in their document No. 239, which gives a standard method of calculation and form of statement. This is the method accepted in the competition code and as it has been prepared with care and represents the combined opinion of many architects, it may be accepted as a good standard.

Definition of "Standard Cubic Contents"

The cubic content (cube or cubage) of a building is the actual cubic space enclosed within the outer surfaces of the outside or enclosing walls and contained between the outer surfaces of the roof and six inches below the finished surfaces of the lowest floors.

Interpretation

The above definition requires the cube of dormers, pent houses, vaults, pits, enclosed porches and other enclosed appendages to be included as a part of the cube of the building. It does not include the cube of courts or light shafts, open at the

top, or the cube of outside steps, cornices, parapets, or open porches or loggias.

Supplementary Information

The following items shall be listed separately:

(a) Cube of enclosed courts or light shafts open at top, measured from outside face of enclosing walls and from six inches below the finished floor or paving to top of enclosing walls.

(b) Cube of open porches measured from outside face of wall, outside face of columns, finished floor and finished roof.

It is recommended that the following items also be listed separately:

(a) Square foot area of all stoops, balconies and terraces.

(b) Memoranda, or brief description, of caissons, piling, special foundations, or features, if any.

Explanation

The above specification of "Standard Cubic Contents" is adopted as a method of conveying exact basic facts about a given building to all interested so that they may be subject to verification without misunderstanding. The basic facts should be the same to all. Each will use the figure in his own way. Valuations per cubic foot will vary with classification of the building, with quality as specified or executed, according to the judgment and purpose of the individual appraiser.

Examples

Cubic contents of buildings shall be stated clearly in form suggested by the following examples:

Office Building of Mr. Blank at Blank Address

	Cu. Ft.
Standard cubic contents	1,750,000
Supplementary information	
Allowance for caisson foundation	150,000

Residence of Mr. Blank at Blank Address

	Cu. Ft.
Standard cubic contents	18,500
Supplementary Information	
Open porches	1,500
	Sq. Ft.
Terraces	200

—Architecture and Building.

NEW HOTEL BUILDINGS BUY AIR CONDITIONING

Big Enterprises, Like Theatres, Find Cooling and Ventilating Pay Nicely at Box Office

New hotel enterprises in cities throughout the United States are becoming even greater buyers of mechanical ventilation and air conditioning than the theatres and department stores, according to a survey conducted by building engineers who have been watching the influence of air cooling and scientific air control on American architecture.

With the average American traveler and commercial salesman more "air or ven-

tilation conscious" than ever, as a result of the educational campaigns waged by the theatres and some of the big stores, most of the hotels have found that the comforts of air conditioning are as imperative for new business as central heating systems and proper lighting.

The torrid heat of July, August and early September emphasized more than ever the need for systematic air cooling in many hostelrys. One of the most prominently known of the hotel chain companies, for example, found that double and triple windows were not sufficient to cool off guest rooms on the hot days and nights and, lacking air cooling systems in all but two of its eastern hotels, bought thousands of desk fans which were sent to guests when they complained about the heat.

Giant hotel buildings recently constructed in Seattle and other cities in the state of Washington conducted aggressive newspaper advertising campaigns directing public attention to the comforts of air conditioning provided in all sleeping rooms. Under the caption, "Weather—Made To Order," a luxurious new hotel just completed in Spokane advertised in newspapers throughout the state this soothing message:

"Day and night, the atmosphere in our lobby and dining rooms and sleeping chambers is delightfully cool, pure and invigorating. In fact, the weather is manufactured—for the health, comfort and enjoyment of our guests and visitors. Ventilation is by our automatic washed air system, which constantly changes the atmosphere throughout the entire building. The hottest days of summer are made as mild and balmy as in May."

The advantages of air conditioning are not confined, however, to cooling during the hot weather, but has its important uses in all seasons because of scientific control of humidity with temperature and the fact that it washes all dirt, dust and odors from the air, the building experts point out. Thus, too, the extreme dryness of heat is prevented during the cold spell.

Significant of the trend, also, is the fact that the Michigan state attorney general recently ruled that well ventilated rooms in hotels may be legally demanded by the state. The law specifies that all rooms must have ventilation from the outside, either through direct access, a court or mechanical means. The act is not broad enough to force hotels to give all rooms outside positions, but adequate ventilation can be required. Similar statutes prevail in many other states.

The building engineers declare, however, that economic law, rather than legislation written in the books, is driving new hotel buildings to the installation of mechanical ventilation and air control. Like the theatres these added comforts find an immediate reflection in the box office.

American
Fire and Marine
Insurance
Company"*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

PHILADELPHIA

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

When Better Floors Are Laid
"ANTI-HYDRO" Will Harden Them

Buick Uses "ANTI-HYDRO"

The concrete floors in this Buick Building are hardened, waterproofed and oilproofed with "ANTI-HYDRO." They cannot rut, leak or deteriorate, because "ANTI-HYDRO" results are permanent.

The severe conditions prevailing in garages quickly ruin concrete floors. Garages consisting of more than one story need absolutely waterproof floors to protect cars on floors below. By hardening and waterproofing concrete with "ANTI-HYDRO" you produce a floor that will last for years—without repairs and maintenance costs.

In one operation and at one low cost "ANTI-HYDRO" makes concrete impervious to water, oil and wear. It is an easy-to-use liquid integral compound, which is simply added to the water used to wet down the concrete mix. In addition to protecting concrete, "ANTI-HYDRO" increases its strength and makes floors, sidewalks, runways, ramps, roads, etc., ready for use in 24 hours.

"ANTI-HYDRO" has been in continuous use for 25 years. Satisfactory results are guaranteed. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

Brick, limestone, steel, 3 stories and basement, 41x58 feet, 18x50 feet, Barrett roof, cement floors, plumbing, steam heat, electric light, metal lath, tile, cement floors, plumbing, steam heat, electric light, marble, steel sash, copper covered, bond, ornamental iron work.

Tire Shop and Service Station, Wilmington, Del. Contract awarded C. J. Dougherty, 600 Tatnall street, Wilmington, Del. Architects, Brown & Whiteside, DuPont Building, Wilmington, Del. Owners, Firestone Tire & Rubber Co., 1201 French street, Wilmington, Del. Brick, steel, 1 story and mezzanine, 50x76 feet, composition roof, concrete and wood floors, hot water heat, electric work, steel sash.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

Don't be discouraged if you make an occasional mistake; if men didn't there wouldn't need to be any claw on a hammer.

TRENDS IN HOME DESIGN

By JOHN WORTH

EDITOR'S NOTE—This report of the recent address of James S. Taylor, acting chief of the Division of Building and Housing of the U. S. Department of Commerce, before the National Association of Real Estate Boards reveals in an interesting way what the modern home builder is demanding.

What sizes, shapes and kinds of small houses are being built in American cities today? How are they finished? What equipment goes into them? What is the modern housewife and homebuilder looking for?

These are questions the Department of Commerce set out to answer and which have been partially answered as a result of its survey of hundreds of homes in 38 cities. James S. Taylor, acting head of the Division of Building and Housing, says they are demanding better architecture, for one thing, and more comfort and convenience.

Modern features that contribute to time saving and labor saving housekeeping, and that make for health and comfort are popular with home buyers, he says.

There is a tendency to cut down on the cubical contents of houses so that now we have somewhat smaller room sizes, lower ceiling heights and more economical arrangement of space.

In the houses visited in the Department of Commerce survey, kitchens were more nearly alike in size than any other room. Most of them contained about 100 square feet, with the width about three-quarters of the length, so that 8 feet 10 inches by 11 feet 8 inches is the typical size.

Living rooms from 11 to 15 feet wide

and 15 to 22 feet long, with the width commonly about two-thirds the length, were most frequent. These figures are based on houses mostly of five or six rooms, which predominate.

Dining rooms tend to be more nearly square, with about half again as large an area as the kitchens. Bedroom sizes run distinctly larger in two-story than in one-story houses. The owner's bed-room in many two-story houses is over the living room and about the same size.

In houses above the lower price range, there is an increasing tendency to have a higher ceiling in the living room by keeping the floor one or two steps lower than the remainder of the house.

In most cities, according to Mr. Taylor, probably fewer really small houses,—say, of three or four rooms—are being built than before the World War. The family that can compress itself into a small space apparently doubles up with another, goes into a multi-family structure, or makes some other provision for its living quarters.

The lowest priced houses now being built in quantity in American cities today are of five and six rooms, with one-story construction apparently predominating in the five-rooms and two-story for the six-room size. Both are popular.

The six-room, two-story house is favored more in eastern cities whereas of the middle and far west, the five room bungalow is in the lead in the lowest price group. In the latter cities, however, the two-story house usually has six rooms.

The popularity of bungalows seems to continue in spite of the arguments of those who maintain that a family gets more for its money in a two-story house.

The modern "motor age" type of civilization is having a distinct effect on home building. The automobile, besides permitting residences to spread out into the suburban area, has affected the size, space and features of the lot and of the house.

For one thing, the front porch, a more or less distinctive American institution, is rapidly going out of style. This is because fewer and fewer people care to watch endless streams of passing motor cars, and the rear of the house is becoming more popular. Alleys are also going out of style and more attention is being paid to the appearance of backs of houses, and designers are called upon to provide for keeping such things as ash cans out of sight.

Now practically every owner requires a garage and as a result, the built-in garage in the modern home has worked its way down from the more expensive houses to the moderate priced field.

On streets where there is any considerable amount of automobile traffic and where garages are built-in or attached to the house, families want to live more and more at the back of the house. A sun parlor at the rear becomes fairly common and the rear living room is becoming more popular. An example of this trend is the home building project at Radburn, New Jersey, where the living room and other important rooms of the house face on a "garden court" which replaces the old background.

The radio, according to Mr. Taylor, is doing its part in keeping people at home and may have some connection with the tendency to provide sun parlors and sun porches which can be used as a second downstairs living room or as a porch, according to the weather. Fireplaces are

provided in a large majority of moderate priced houses and this too indicates a tendency towards making the home more of a center of social life.

Electricity in general has come to play a most important part in the design of homes. Its use for light, electric irons, toasters, refrigeration, operation of vacuum cleaners, washing machines, and most recently for heating by means of large hot water storage tanks which consume current provided at special rates during the hours after midnight when other power requirements are at a minimum, are examples of what this new element in American life is doing. All this involves more wiring and many outlets.

The bathroom, Mr. Taylor says, is more and more becoming one of the most conspicuous features of many new small houses.

"I recall one bathroom in a rural house selling for less than \$6,000," he said.

"Although small, it looked fit at least for a millionaire screen star, with its floor of black and white tile, buff colored tile wainscoting, special wallpaper showing sea scenes and the built-in bathtub with shower attachment.

Color is Vogue

"The bathtub on legs is going out of style, even in the lowest priced new houses. The types replacing it have practical as well as aesthetic advantages because they have no space underneath to be kept clean, and with the saving in floor covering the total cost of the bathroom may be only slightly greater. In the houses covered in our survey, three-fourths had tile floors in the bathroom, and about one-half tile wainscoting."

One of the most important recent trends in home building which has had a marked effect is the vogue for color, says Mr. Taylor. This has a good and highly commendable side, he points out, but it also has its difficulties. If a man paints his house or roof the wrong color he can easily repaint when he tires of it. Changing the color of certain materials and interior equipment, however, is impossible without actual replacement.

Another phase of the home building business has been the keen competition between manufacturers of materials and the resultant advertising campaigns. This competition has not only affected the demands of owners he points out, but has resulted in research into the best methods of using the different materials.

A distinct improvement has taken place in American architecture which shows that the average person is becoming more appreciative of good design and architectural treatment. More operative builders, according to Mr. Taylor, appreciate the importance of good architectural service and employ architects on their staff or as consultants.

In a desire to please prospective owners, efforts to present something out of the ordinary have been directed more towards adapting historic and provincial styles than to pure exercise of the imagination which produced the so-called gingerbread ornamentation and other sad architectural features of past years.

The small builders' organization is likely to be weak on the matter of design. Control of the color, general type of the house and its height above the grade line of the property and its relation to the adjoining houses is almost as important as the design of the house itself, he points out.

The effect of the treatment of the kitchen door on adjoining properties, the effect of the height of the side terrace and lawn on adjoining homes, and the effect of some particular design on the already established design of other houses in the block all should be given consideration.

There has been considerable difficulty with bad combinations of colors and particularly with colors of various types of manufactured materials which, when assembled, are found to clash.

To improve the looks of a good building, attention should be paid to such things as grouping together houses of fairly comparative costs, keeping bungalows out of two-story house districts and two-story houses out of bungalow districts and adapting the style of house to the topography.—*Building Age*.

SCIENTIFIC RESEARCH ON BRICKLAYING AT MELLON INSTITUTE

An interesting example of collaboration between scientist and artisan is found in the broad scientific study of bricklaying

recently inaugurated by Mellon Institute of Industrial Research and the Eastern Face Brick Manufacturers' Association. The experiments are being carried out by Dr. F. O. Anderegg, Senior Industrial Fellow of the Institute's Multiple Industrial Fellowship on Portland Cement, and his assistants; architects, building contractors, and masons are aiding the work by contributing opinions and advice based upon experience.

So many varying factors are involved in the construction of a brick wall that it has been necessary to limit the experimental study to combinations of variables representing the probable range of practical application. Hundreds of thousands of experiments would be required if all possible combinations were to be studied. For this reason the research program has been under discussion for a considerable period of time, and the actual investigation was begun only when a satisfactory plan had been elaborated. Up to the present time some 300 experimental walls or panels have been erected on the grounds of Mellon Institute Building No. 2; a supplementary series will be constructed during the winter.

In brief, the investigation will cover certain aspects of all the factors involved in bricklaying. The most obvious points of attack are studies of the characteristics of different kinds of brick and mortar. Problems of special appeal to the practical man are those concerned with different methods of backing and with differences in workmanship. The design of walls and their relative elasticity are subjects which will be of considerable interest to contractors and architects.

Brick and mortar problems under investigation include the absorption and surface characteristics of brick, and differences in mortars due to varying the cementing materials, sand, and pigments.

Properties of the mortars which are being studied carefully are workability, compressive and transverse strength, absorption and permeability, shrinkage, durability, staining and efflorescence, and elasticity. Information is being collected to determine whether the 10 per cent of lime often specified by architects or the 25 per cent or more usually employed by brick masons gives better all-around results.

The problems in backing include a study of hollow tile of different sizes, of brick, of cinder or concrete block, of brick tile, and of metal or other lath in steel frame. Variations in workmanship are most apparent in regard to tapping, pointing, and the filling of head-joints. The first mentioned subject is being studied, not only in regard to the effect of excessive downward tapping into place, but also in regard to plumbing both before and after initial set.

Among the most important problems of design are the nature of the backing unit and the method of connecting the face and backing. Coping and parapet construction are likewise being investigated. Capillary contact with the ground and condensation allow moisture to penetrate into the wall and must be guarded against. Finally, a study of special interest in this day of high buildings is the elasticity of walls of different types.

Special mention should be made of weather problems. The experiments have been planned for the purpose of investigating the behavior of mortar with reference to the other variables in all types of climatic conditions.

The whole study provides an additional instance of the manner in which scientific methods are adapted to every day problems. Scientist and engineer, business man, architect, skilled workman, and laborer are all working together for the

BUSINESS WILL FINISH YEAR AT HIGH LEVEL

*Industry Generally Responds to Fall
Impulses, Fan Blower Survey
Shows*

Record sales of fan blowers and ventilating equipment during the first eight months of the current year, combined with a huge volume of unfilled orders for future delivery, carried with it assurances of a continuation of unusual industrial and business prosperity for the last quarter, according to J. F. G. Miller, of Detroit, vice-president of the National Association of Fan Manufacturers, and an outstanding spokesman of the industry.

"Despite a tightening in the credit situation, industry and commerce are responding encouragingly to the buying impulses of Fall, while inquiries from industrials for air handling equipment indicates that leaders generally are confident that 1930 will bring a new peak of activity in special lines," Mr. Miller said. "The motor industry seems to have passed its summer low mark, while there are sound reasons for believing that the steel industry will be following the upward curve early in October."

Mr. Miller notes an aggressive expansion of new building activity in certain directions, particularly among public utilities, and new industrial plants. The phenomenal prosperity of the big public utilities has brought about large scale construction of new power plants and other buildings as reflected by the demand for mechanical draft equipment which has proven a boon to the utilities in increasing power production, Mr. Miller said.

"It is significant that manufacturing plants, builders of new structures and railroads would not be investing heavily in mechanical ventilation and other improvement if the outlook did not warrant confidence," Mr. Miller pointed out. "We have been able, year after year, to accurately forecast the business trend in important lines of our sales prospects and a careful checking of this fan or blower index gives us every worthy reason for believing that business generally during the next 90 days will run safely above a normal good average."

"Exports of our own products this year were far above the record of last year. With the opening and broadening of new markets abroad, due to greater foreign appreciation of American com-

forts, this channel for new business will become even more important."

Reports received by Mr. Miller showed that the prosperity of the ventilating manufacturers has been shared also by allied interests such as several of the largest electrical industries in the sale of refrigerating apparatus for air cooling and of motors for operating fans.

The fan association's survey of the business situation included reports from such widely distributed and important manufacturers as: the Buffalo Forge Company of Buffalo; the American Blower Corporation of Detroit; Bayley Blower Company of Milwaukee, and three in Chicago: Ilg Electric Ventilating Co., Garden City Fan Co., and the New York Blower Co.

CO-OPERATION NEEDED IN BUILDING INDUSTRY

THE BUILDING industry is like Europe where each country is afraid of and antagonistic to the others and never feels secure. This is because they are not acquainted with each other and are always suspicious of the others' motives. The cause of the whole trouble is *ignorance* which generates fear.

THAT IS the trouble with the building industry. Knowingly or not, many of the elements of it do not have an understanding of the real function of the others and ignorantly assume an undue importance for themselves and depreciate the true importance of the others.

NOW, THE most complicated thing in the world is the modern building. From first to last it involves a host of men, trades and professions, each capable of carrying on his own part. But no one man, trade or profession can produce a building alone. Collaboration is necessary.

TRUE COLLABORATION by the numerous factors can only be realized when each one admits its necessity. Then only will the ignorance of the others' functions and importance vanish.

THE WHOLE industry is out of balance and no one factor is receiving its just compensation and profits. The organized trades are the only exception and their strong position results from each trade backing up the other for the benefit of all. They are not concerned each with the true function of the other—it is a case of self preservation.

WITH THE trades out of the way, what of those professions which make the industry possible? The architect, the several branches of the engineering profession, contractors and manufacturers have a common interest and meeting ground—the plans and specifications. The differences that exist between those who contribute to and execute the plans and

specifications are not to be adjusted by trades' methods but by other means.

THIS COMPLEX thing—the plans and specifications—is the product of people qualified for their particular work. Each contributes personal services and they must be in correct adjustment each with the other. It can be produced only by joint action which involves interdependence.

INTERDEPENDENCE IS galling to those who suffer from "arrogant ignorance"—not only to their own detriment but the detriment of all the others. Interdependence is inescapable and is an actual condition and not a theory. Interdependence must be accepted willingly before the industry can be balanced. While it is absolutely true that "on the structural frame hang all of the building and its contents," it is equally true that the structural frame alone does not constitute a building.

STRUCTURAL ENGINEERS realize this and also the interdependence of structural engineering and other professions, contractors and manufacturers. They are confronted with many adverse conditions that must be corrected and at the same time they realize that the other professions, contractors and manufacturers are confronted with their own adverse conditions.

GET TOGETHER, then, seems to be the only basis for an equitable adjustment of the ills that afflict the building industry. "Get together" involves an understanding of the function, the process, the responsibility and the relationships of each party. To do this, each party must advise the others of their own particular position in the industry, the ills from which they suffer and the causes of these ills.

FAIRPLAY and a decent spirit of sportsmanship, when a mutual understanding arrives and ignorance—arrogant or otherwise—is abolished, will adjust the relationships that exist in the building industry to the benefit of all.

Correct relations are the bases of social and economic welfare.

On the structural frame hang all of the building and its contents.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

write practically every form of Insurance, except life

The U. S. Navy Uses

"ANTI-HYDRO" for Waterproof Concrete

All concrete floors and pits in the huge foundry building at the League Island Navy Yard are permanently waterproofed with "ANTI-HYDRO." This job is twelve years old. It is built right on the waterfront. The concrete floors and pits are subjected to the most severe conditions, but "ANTI-HYDRO" has so thoroughly waterproofed and hardened the concrete that it is always dry and the floors never dust.

In one operation and at one cost "ANTI-HYDRO" hardens, dustproofs and waterproofs concrete permanently. For 17 years the United States Government has used "ANTI-HYDRO" in the Navy and other departments. Architects, engineers and builders everywhere use "ANTI-HYDRO" because of its economy and guaranteed results.

Because it is a liquid integral compound, "ANTI-HYDRO" is extremely easy to use. Simply mix it with the water used in wetting down concrete. Any unskilled laborer can do it. Saves finishers' time, too, because it accelerates the set of concrete and eliminates costly overtime work.

For 25 years "ANTI-HYDRO" has proved its reliability on every type of concrete hardening and waterproofing work. Use it on your next job for economy and guaranteed satisfaction.

Courageous Spending

An Address by CHARLES F. ABBOTT,
Executive Director, American Institute of Steel Construction, Inc.

Today successful businesses are conducted on an entirely different plan from that which prevailed in the pre-war days.

To manage a business successfully requires as much courage as that possessed by the soldier who goes to war. Business courage is the more natural because all the benefits which the public has in material wealth come from it.

The problem of sales management is far more important than it ever was. We must not only teach our salesman how to sell, but, what is of greater importance, we must teach the public how to consume.

There are many sales executives who have come to the conclusion that we are passing from the age of *salesmanship* to that of *consumership*. We are shifting the emphasis from the old personal arts of salesmanship to the *statesmanship of consumption*. We are interested more in creative spending than we are in clever selling. The problem of *sales management* is of greater importance than it ever was.

In the past, business has been operated on what we may call the economy principle, the principle of paring down and of saving; and it has a wonderful and worthy background. America would never be what is without it.

But as this policy has had to pass; as we now understand that the hold-tight, spend-as-little-as-you-can principle must give away to a new more constructive and aggressive outlook—so business is now beginning to emphasize the principle of *creative spending* rather than that of pinching economy. We feel it in our family, in our business, and in our national attitude.

We do not need the old quality of *caution* today nearly so much as we need the new, the courage to plan and chart enterprise. In days when panics were just around the corner we naturally needed a great deal of caution and watch-dogging, but the panics of business are gone.

We now have bigger things than merely guarding what we already have. We have a vast creative job ahead of us to raise the standards of living of the 73 millions of people who still exist at or below the Minimum Comfort Level.

We now know that if we are selling industrial equipment our market is limited by the sales of our customers to the public. If they could sell more we could sell more to the factories; therefore the need of studying conditions that underly consumer buying.

We are discarding the old economic

idea that business is limited and that we must fight like three dogs over two bones to get it. We are realizing that in industry full of unequal units—some very modernly tooled and some poorly tooled; some using up-to-date methods and some ancient methods; some practicing enlightened principles and some practicing unwise principles—need not be accepted with no change possible, simple as the way fate deals out the cards.

We know that something *can* and *must* be done about it. We must lift up an entire industry toward a higher average in tools, methods, and business principles. We are willing to spend money to accomplish it—a great deal of money, individually and collectively. That is courageous and creative spending, the statesmanship of consumption, and genuine progress.

Cyrus Curtis, head of the Curtis publishing interests, once said he had an executive in his employ whom he had to discharge *because he could never teach the man to spend enough money!* The man had been trained in the old school where all the credit went to the man who *saved* the most.

When the time came for a decision to spend \$100,000 of Cyrus Curtis' money,

promptly and effectively, this man's hand trembled, he procrastinated, and the business suffered. Of course, some other men, even more incompetent, might have spent too lavishly and thoughtlessly. What was needed was a well balanced, keen-minded man who knew how to spend creatively; a man who would decide promptly and courageously, and then spend.

No better illustration of courageous spending exists than that of Ray Smith, Pres., of the A. O. Smith Co. of Milwaukee. With nothing but an idea, about eight million dollars were appropriated and expended before the idea was found to be practical. A great deal of courage and a lot of money was required but the production of automobile chassis was increased from a few hundred to 10,000 per day. At the same time the manual staff was decreased to a fraction. Four hundred engineers engaged in research made possible another reduction in the sales force and only 8 are now required to dispose of the output. To go a step further the same idea was perfected to apply to welded steel pipe with the result that 26 miles of pipe per day are now being shipped. Simultaneously every other plant engaged in producing automobile chassis and steel pipe was rendered obsolete, unable to compete with such remarkably low costs. Without the courage and the spending as inaugurated by this one man the public would never have received the benefits of these unusual results in cost reductions.

Instead of the hang-on-to-the-dollar type, there was needed the spend-plenty-of-money promptly-on-competent-analysis type. The old guiding general principle was *saving*; the new principle is *construction*. Both are wonderful, useful American traits, but right now we need the latter type.

Business is now being transacted on a large scale because our people have the income which makes large scale consumption possible. Small business units cannot successfully serve such a public demand. There have been nearly two

thousand mergers in the past two years. More are to follow because it is the large organization that alone can meet efficiently the problems of distribution that modern conditions are creating.

Where smaller units of industry can operate economically in the field of production they are organizing into institutes and similar associations in order that they may take advantage of the economies possible through co-operative effort in the field of distribution.

These organizations, as well as co-operative merchants, are successful only so far as men can be found who can operate them, men who understand big scale spending, men who can courageously authorize creative advertising appropriations running into millions of dollars and conduct their affairs with the greatest economies; men who can competently make big decisions and make them promptly when the necessary facts are in, and if the facts are not in, then go out and get them. That is the modern research technique which moulds the judgment of the courageous spender.

We have already learned, as Carnegie taught us in the steel industry, that our plans should be for tomorrow's greater profit. This is what should govern our spending today—not what we did or spent last year. Carnegie scrapped one steel process after another, sometimes before the shine was off the million-dollar equipment, simply because he was investing in greater future profits and a greater competitive advantage. By doing so he plucked the steel leadership right out of England's hands, never to return.

The steel skyscraper has done the same. So profitable is this creative process that we are tearing down modern buildings, only ten or twelve years old, to erect others in their place which will make more money for the owners. A man who owns a 12-story building, fairly modern and built ten years ago, standing on ground rapidly becoming more valuable, finds that he is unable to get out of that building a proper return on the in-

Proposal

LIBRARY BUILDING
at
WEST VIRGINIA UNIVERSITY
Morgantown, W. Va.

NOTICE TO CONTRACTORS

Sealed bids will be received by the State Board of Control at its office in Charleston, W. Va., until 2.00 P. M., Wednesday, November 27, 1929, for doing all work and furnishing all materials necessary to complete the building described below, according to the plans and specifications of Davis, Dunlap & Barney, Architects, 1805 Walnut Street, Philadelphia, Pa. Separate bids are required for the general construction, for heating and ventilating, for plumbing and for electrical work.

The building occupies an area of 151 feet 6 inches by 118 feet 2 inches, and consists of a Ground Floor, First Floor and Second Floor, and a Fan Room and Warm Air Ducts under the ground floor.

The Ground Floor contains the Administration Offices, the seminars and studios, toilet rooms, storage and bindery, unpacking room, and the janitor's work spaces.

The First Floor contains the General Reading Room, Assignment Reading Room, General Delivery Room and Catalog Work Space.

The Second Floor contains the Periodical Room and unfinished portions for the future Graduate Reading Room, Special Reading Room, seminars and toilet rooms.

The Stack Room extends from the Ground Floor up to the underside of the Second Floor. The elevator hatch extends from the Ground Floor to the Pent House.

The central portion of building is of steel skeleton construction.

Generally, the first floor construction is of reinforced concrete beam and slab construction. Rear portion is of steel beam and reinforced concrete slab construction.

The second floor and main roof construction is of steel beam and girder and reinforced concrete construction. The other portion of roof and floor construction is a composite steel and reinforced concrete beam and girder and reinforced concrete slab construction. A temporary plank and slag roof is to be placed over the main roof slab.

The building also consists of reinforced concrete footings and foundation, brick walls

with cut stone trim, cement floors, terrazzo floors, cork tile and linoleum floors, composition floors, metal stairways, metal sash, interior marble work, interior wood finish, plain and ornamental plastering, waterproofing, painting and decoration, roofing and sheet metal work, hardware and elevator equipment. No book stack equipment.

Heating and Ventilating includes Hot Water Heater, ventilating units, Aerofin units, fans and motors. Heat of steam from Central Plant.

Plumbing includes drainage, hot and cold water supply, gas supply and plumbing fixtures.

Electrical Work, conduit, wiring, switchboards and panel boards, telephone system, fire alarm system, buzzer system and lighting fixtures.

Plans, specifications and blank form for bids will be mailed to GENERAL CONTRACTORS by the State Board of Control when request is accompanied with check in the amount of Fifty Dollars (\$50) which amount will be refunded only on receipt of bona fide bid and the return of the plans and specifications.

Plans, Specifications and blank form for bids will be mailed to Mechanical Contractors, Heating, Plumbing and Electrical Work, when request is accompanied with check in the sum of Twenty-five Dollars (\$25), which amount will be refunded only on receipt of bona fide bid and the return of the plans and specifications.

Certified check in the amount of 1 per cent of the bid made payable to the State Board of Control must accompany the bid, and same will be returned to all unsuccessful bidders immediately after opening.

Surety bond will be required of the successful bidders, according to our law in full amount of the contract price.

(My commission expires March 2, 1933.)

A certain wallboard man advertised in the Guide for awhile and then dropped out. We've had a dozen inquiries since then, asking for his address—every inquiry from a cash buyer. This is a common occurrence. It's hard to make some advertisers see the vital importance of a standing "ad."

creased valuation of the land, or as large a return as possible. But that is not all. His tenants cannot get the up-to-date elevator service, office standards and comfort from the building erected ten or twelve years ago, so rapid has been our advance in building conveniences.

Exactly the same holds true of the manufacturer who decides to own a modern plant. He might believe that he could continue to manufacture in his old tumbledown factory, erected before modern ideas of routing or sanitation were known. But if he considers the cost of handling materials, and his engineers make full use of every new tool, new method and new principle; reducing labor to a minimum and applying the latest equipment, the manufacturer will undoubtedly find that he has been paying an immense premium every year to remain in the old plant with the old equipment.

It all figures down to an engineering and mathematical basis. Here lies the big task of tomorrow for all industrial advertisers—to sell the idea of creative spending, and even of creative wasting, to more people.

Many people are controlled by prejudices and fixed ideas more than by what their lead pencils would tell them if they sat down and did some simple figuring. They are obsessed with the waste idea, like the English manufacturer who insisted on wearing out his present machinery before he would consent to buy a new machine which would make *all* of his old machines unnecessary! There are too many who have never clearly understood the relation of their spending to the general state of prosperity and the ability of consumers to buy more of their goods.

We need bold, determined, aggressive spenders; daring but cool; risk-taking, confident, even colossal spenders. Does this sound startling? Don't be afraid. Carnegie was called a colossal spender because of his fast scrapping policy, but Carnegie literally set the modern American industrial pace.

In our keen interest in Ford and the automobile industry we forget that the steel industry in the United States really took the lead and changed the entire program of American industry.

Carnegie was the Ford of yesterday, and with his scrapping policy he laid the foundation on which modern business rests. He introduced a new kind of dynamics into business—speed, punch and

courage to go forward, whatever the cost in waste, if the engineering facts pointed the way. He introduced the line and staff organization and respect for experts and for research.

It is no accident that the present has been called the steel age. Steel not only holds up our great skyscrapers, but the history of steel is the history of industrial America.

Every one of us has set up a howl when our wives finally threw away our old suits, or hats, or shoes. We cling to them because they are comfortable and we are used to them. But one spring house-cleaning day the wife got a determined hard-hearted look on her face and said "Out with them—I don't care what he says!" This is exactly the spirit we need.

Women are far keener on economics than men are. In the matter of clothes they have been creatively spending for centuries, and look how successful they've been with us by doing so!

We need men who will go around a factory or an office with just the same determined look and say "Out with it—I don't care what he says!" We may dislike to see the junk man make much money, but take it from me, for every dollar the junk man makes, we would make a thousand.

Hanging on to old, out-moded goods is a terrific brake on progress. A man once said to me "I have a suspicion that any city would be better off if an earthquake came along every ten years and shook to pieces everybody's factory, office and equipment. It seems as if nothing but an earthquake could ever make some people wake up to their need for up-to-date equipment. Did you ever notice how vastly improved and more efficient and prosperous a city is that has had an earthquake or a flood or a fire?

"There's no mystery about it—everybody buys new equipment, business is brisk, and production is increased because

the tools are better. And why shouldn't everything be much better? It is new and up-to-date."

Up in Vermont there was an old farmer who kept a barrel of apples for the family during the winter, and he instructed them to first pick out the specked ones when they wanted apples. The result was that all winter long the family lived on specked apples, because by the time the first selection of specked apples was eaten, the others had become specked. They were practicing the old pinching economy principle instead of creative waste.

If you think that is an unimportant illustration, think it over. It exemplifies the old idea in the change that is going on today, and points the way to the new psychology that is being developed.

Literally billions of dollars of possible sales lie frozen because of the old shortsighted economy ideas; the eating-specked-apples psychology. These people who are living in yesterday's house without modern features; working in yesterday's factories and offices, without up-to-date equipment; and operating yesterday's tools, methods and principles, *are blocking the way to far greater things for America*, and we should push them out of the way if they can't be argued out of the way.

If people were not as desirous of getting into better houses and offices we would slow down the remarkable pace of construction activity which has been going on since 1922 at an annual value of about seven billion dollars. We have it on the authority of the New Hoover Committee on Economic Changes that this great seven billion dollar construction program has acted as a stabilizer and a tonic to general business.

It is one of the most astounding demonstrations of creative spending that we have today, because it is being carried on in spite of the fact that building costs have been higher than the general price level compared with pre-war conditions. We are not waiting for the day when costs will be lower—we are building bigger and better offices, public buildings, better residences and more modern apartment houses. We are not content with the standards of yesterday.

The same progressive pace has not been fully maintained in the field of industrial equipment. When high speed steel was first introduced, many manufacturers were *forced* to re-equip their plants with machines that would drive high speed steel. But why wait until they are forced? That is precisely what my friend said about earthquakes.

Why not go at the *job creatively*? Not all the builders are taking the fullest advantage of the rapid advances in new materials and metals. Astounding new things are being developed, but much of the new that we already have has not been widely used. Our equipment should be made with the very latest materials for greater efficiency.

Industrial advertising interests should assume the greater part of the burden of teaching courageous spending. You must do the educating. It is a big task to break down habit and general outlook on life, which is the real problem that stands in the way, but it can be done.

It is often easier to sell a man a yacht which will prove a big expense to him, than it is to sell him a profit-making idea of value to his business. We must never let up in our fight, because our industries will suffer by comparison if we do. We

cannot lag behind in this fast modern pace.

Contrast this with an up-to-date purchasing policy, which is far keener to buy an article of merit than you could possibly be to sell it. Some time ago a modern concern with a research laboratory decided that the use of a certain kind of fabric much stronger than that being used would improve the goods. But no mill would sell it to them. "It can't be made," they said. Here was a customer eager to spend creatively, but the sellers were years behind in research and had never dreamed of offering the kind of goods they wanted.

But the buyer was ready for them. "We will send our experts into your factory and teach you how to make it," he said. Even then the mills balked, and now the buyer has organized his own mill. Sellers cannot stop the virile up-to-date buyer from creative spending when they are too backward to beat him to it by offering him what he wants, and when he wants it.

The system of producing advertising appropriations is wrong, as practiced by the average firm. The task that is desirable should first be set, and then figure the cost of accomplishing it instead of arbitrarily fixing a percentage or setting a figure than can be "afforded."

Listerine, one of the most spectacular sellers among advertised goods, for three or four years spent on advertising *more than its profits*—but it was remarkably creative and profitable spending, as you can see by looking at their figures today.

Opportunities for profitable business will escape those who fail to take full advantage of the possibilities that are offered. Success will never come to the man who refuses to keep in time with this modern tempo. Nothing is so detrimental to a growing business as the failure to spend an amount equal to the tasks set for the spender.

Failure to do as did the owners of Listerine, Wrigley's Spearmint, Campbell's Soup, and the host of other well known successful products is usually not because there is any lack of men, but because there is a distinct lack of market analysis and business courage. The weaker, less able business men never rise to a mental level high enough to understand courageous spending. They will spend only as they must and pinch their dollars too lovingly, with a hoarding impulse. The advertising man has had more object lessons in this than any other man in business.

Under the changed conditions of today the only hope of the smaller concern for profit is to abandon any idea of mass production and selling on a small margin of profit and substitute for such a policy the sale of specialized advertised goods to a specialized group of customers and then back up every sale with a highly de-

veloped service. In the past we concentrated every sale on the tangible facts represented by the product offered for sale. Today, all emphasis is being placed on the intangible represented by Service. To sell what the article does, not what it is, constitutes the modern conception of selling.

If an industry actually knew of the opportunities for a greater use of their product, of the waste that occurs in failing to develop new uses and new markets and the loss in profits that could readily be realized it would immediately insist upon organized co-operative research and supply the funds to finance the operation. Courageous spending, it is true, but why should so much courage be needed when the results are so obviously profitable?

In the meantime the trade publications and business papers should see to it that these facts are assembled and properly presented. To do so would be in line with a much needed program of education.

Only the man who is sure of his results is courageous in his spending. He has no doubts as to the outcome. The steel industry has produced some such men, though it still is in need of developing a better public consciousness. "As hard as steel" is quite generally recognized, but that does not improve the standing of the material in the eyes of the public. If, instead, we could get people to say "as fine as steel," we would be accomplishing something. But to do that would require a real advertising appropriation.

George M. Verity is a good example of the courageous spender. "Go ahead and try" was his slogan in August, 1914, when Armco Iron was first produced. His policy was to "go ahead" and find out what the buyer wants, "go ahead" and find out how best to produce it. Go ahead and do. Go ahead and tell. He co-ordinated his selling plans with his production—he did not hesitate to discard the supplanted machine. He has kept as a permanent asset the first "go ahead" order.

By advertising to the employee, the stockholder, and the public, as well as to the ultimate consumer, the American Rolling Mills Company has developed a consumer acceptance for a raw material. They have not hesitated to continue advertising even in a notorious "sellers' market" because they wished to retain the good will of their customers. They have engaged in collateral advertising to promote the sales of the fabricator of their material. Such advertising has lifted Armco Iron out of the rut of raw products, and placed it in the forefront of consumer thought. It has been expensive, but it has more than paid dividends. That is what I call courageous spending.

In the whole field of advertising media there are no more important publications

to be considered or more thoroughly deserving a larger part of the appropriation than the trade and industrial publications. They form the very basis for the essential educational effort so necessary if the industry itself is to be advanced. They blaze the trail for creative spending because they speak for the industry and thereby assert its leadership. The public are recognizing more than ever before trade publication advertising as being the real dependable source of information.

There is room for improvement in the character of industrial advertising but on this point the advertiser himself must be educated. He must be brought up and away from the old style of buying space and filling it with a card or the mere announcement of the company name. Space of suitable size to perform the task should be purchased and then filled with real constructive advertising of the modern character. Always its arrangement and preparation should be considered as an investment from which tangible results are to be expected. It should never be classified as an expense or as an offering of charity. Putting up the right amount of money to cover the field effectively calls for courageous spending, but if the advice and service offered by the trade publications are followed, the returns that are possible will far outshadow the original amounts appropriated. Courageous, creative advertising is the real secret behind successful selling and profitable operation. Without its influence it is impossible to compete favorably with those who recognize the value of public acceptance and goodwill and are alert to cultivate these advantages by sound advertising.

It is not alone with consumer advertising that we must contend. That has been developed to a high point. We are sadly in need of giving more attention to the promotion of consumer acceptance of the basic raw materials. Your work is largely before you, but it is uncharted. The courage of the pioneers has shown the way and proved the principle. Let us continue in order that American industry may be lifted to even higher planes of usefulness.

We are doing a greater and better job in advertising than we ever dreamed of doing in the old days. It is costing more money but it is breaking down resistance, promoting bigger things because it is genuinely creative spending.

The technical and industrial field is rapidly coming into the bigger sphere of usefulness, and he is a bold man who can predict where this era will end. A single advertiser today probably spends as much as the entire industry did in the old days when industrial advertising was looked upon solely as a handout, or as mere good will or institutional advertising.

I have an idea that ten years from now, perhaps less, we will look back even on

today as mere pioneering in the bigger things to come in creative spending. But I am also sure that your organization will continue to be, as in the past, at the very tip of the forefront of the advance.

Diverse mortgage laws that delay the rapid marketing of mortgages in interstate transactions, cost large investors millions of dollars a year, according to General F. M. Bass, of Nashville, Tenn., Counsel for the Mortgage Bankers' Association of America, who will talk on the advantages of a uniform law before the coming convention of the Association to be held in New Orleans, October 29 to 31.

With mortgage laws different in every state in the Union, from the actual wording of the documents to the methods of foreclosure, organizations such as large insurance companies that buy mortgages to the tune of a million dollars a day, must maintain legal staffs to examine the papers in each transaction and see that they check with the laws in the state from which they emanate, points out General Bass.

With probably 250 insurance companies buying mortgages in block lots in forty-eight states every day in the year, not counting other large investors that purchase mortgage paper daily, the work of complying with the provisions of 48 state laws has assumed tremendous proportions, says the Association attorney. Insurance companies alone now hold over six billions of dollars in mortgages.

In other words, a mortgage in Arizona is made and handled under entirely different circumstances than a mortgage in New York, and the two when brought together would hardly recognize themselves as cousins.

"The work done by large mortgage buyers in preparing, copying, examining, and transferring alone is figured at an estimated \$5,000,000 a year which could be saved to purchasers if a uniform law existed, and if shorter and less cumbersome forms were adopted in the various states," says General Bass.

"In the matter of foreclosure clauses alone, the state laws provide for redemptions in case of default at from a few days to several years.

"These items may seem small in the case of one mortgage, but multiplied hundreds of thousands of times, are running into the salaries of attorneys, accountants, and clerks, that might be saved to a large extent through greater uniformity.

"The present situation stems the easy flow of money between states which is necessary if mortgages are to compete with other readily negotiable securities. We know the present variations in the mortgage laws are costing large investors millions of dollars a year; but we have

no record of what this situation is costing the mortgage banker in business he does not get.

"Due to their great safety and comparatively high yield, mortgages always have occupied a place of great importance in the investment field as borne out by the fact that the insurance companies alone have forty-two per cent of their total investments in this form of security. However, investors, large and small, would hold the mortgage in even greater esteem if they could buy it in a more standard form, and thus be able to eliminate the costly process of checking in seventy-seven different directions."

General Bass points out that the proposed uniform mortgage law is not the first uniform law brought about by business men. The Negotiable Instruments Law and the Uniform Sales Law have cut away red tape and duplication for bankers and business men and have saved them millions of dollars a year.

As a result of the two uniform laws referred to above, business men can do business with each other with ease, from state to state; and it is possible, for instance, for a manufacturer of automobiles to sell his cars in Omaha, Nebr., on the same basis as he sells them in Peoria, Illinois.

The bankers' convention will discuss a uniform mortgage law which has already been drafted by the American Bar Association and will consider whether this or any other uniform draft is feasible for adoption by the various states.

The standard clause of the American Arbitration Association has been adopted for the first time by a major Building Exchange or Congress in the recently announced action of the Los Angeles Building Exchange. The clause makes mandatory the settlement of all disputes between members or between members and clients by submission to expert business judgment rather than recourse to litigation.

A warning, "Safeguarding Business Contracts," issued by J. Roydon Estey, Master of the Arbitration Tribunal of the Builders' Congress of Los Angeles, which was praised by Lucius R. Eastman, president of the American Arbitration Association, at 521 Fifth Avenue, New York City, called specific attention to the clause.

"Having proposed or suggested all the safeguards possible to prevent disagreement in making contracts," the warning read, "the Builders' Exchange offers the last and final safeguard to prevent, and a solution to solve the problem where disagreement has crept in despite careful preventatives. Instead of rushing to courts of law with their long, expensive and good-will destroying results, we advise the use of our Arbitration Tribunal,

established for this purpose. The following resume of Arbitration and how to use it should be carefully studied and then put into practice.

"Provide for the prompt, economical and binding settlement of disputes arising out of the performance of contracts or business agreements by inserting in such instruments the following clause:

'Any controversy or claim arising out of or relating to this contract, or for the breach thereof, shall be settled by arbitration in accordance with the laws of the State of California, under the Rules of the American Arbitration Association, and judgment may be entered on the award in any court having jurisdiction.'

"An arbitration clause provides for the arbitration of a future dispute (labor not included), and is intended to assure the parties against litigation or delayed settlement when a dispute subsequently arises. An arbitration clause is valid, irrevocable and enforceable in the State of California. By 'enforceable' is meant that the Superior Courts of this State will require the arbitration to proceed and will stay any suit or proceeding brought in violation of the agreement. By 'irrevocable' is meant that the arbitration agreement cannot be revoked at the will of one party, but only upon such grounds as exist at law or in equity for the revocation of any contract.

"The presence of an arbitration clause in a contract frequently prevents disputes from arising. Experience has proved that when parties know that the matter in issue is to be judged by an unbiased expert in the trade in which the dispute arises, and without delay, such knowledge tends to reduce the number of trivial or ill founded claims, which might have a chance with a jury or by reason of a resort to legal technicalities or claims made to delay the payment of the obligation. If a contract or agreement does not contain an arbitration clause, one of the parties to a subsequent dispute cannot compel the other to arbitrate the issue if he does not wish to.

"Arbitrations are conducted in tribunals (informal courts). The proceedings are called hearings and the judgment or findings of the arbitrator an award.

"The American Arbitration Association is the recognized authority in such matters, and its Rules of Procedure are generally acceptable to all parties.

"The award of an arbitrator in this State has all the force and effect of a superior court judgment; and can be recorded and dealt with in like manner.

"The total cost of an arbitration is usually but a small part of the expense involved in the trial of a similar action in court, while the time involved is ordinarily but a matter of days.

"The Builders' Exchange of Los Angeles, located in the Chamber of Com-

merce Building, maintains an arbitration Tribunal that is open to the public without respect to trade or affiliation. Here advice and counsel on arbitration matters are given without charge. The Tribunal is presided over by J. Roydon Estey, a member of the National Panel of Arbitrators of the American Arbitration Association, and one who is well equipped by experience and knowledge to direct the work of this important program."

Although the Los Angeles Exchange is the first to adopt the standard clause of the American Arbitration Association, it is not the first to establish equitable and irrevocable arbitration rules. Among those Congresses and Exchanges which have established rules peculiar to their respective needs in conjunction with the Association are the New York, Philadelphia, and Indianapolis Building Congresses. The experience of each, as set forth in their periodical reports, indicate a material saving in time required for a final determination of issues involved; a speedier freeing of frozen assets in construction controversies; an appreciable saving in moneys heretofore spent in litigation; a greater respect for the ethics of the industry on the part of the public, and an increased friendliness and mutual confidence among members.

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood, and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. A carload of details can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

The U. S. Navy Uses

"ANTI-HYDRO" for Waterproof Concrete

All concrete floors and pits in the huge foundry building at the League Island Navy Yard are permanently waterproofed with "ANTI-HYDRO." This job is twelve years old. It is built right on the waterfront. The concrete floors and pits are subjected to the most severe conditions, but "ANTI-HYDRO" has so thoroughly waterproofed and hardened the concrete that it is always dry and the floors never dust.

In one operation and at one cost "ANTI-HYDRO" hardens, dustproofs and waterproofs concrete permanently. For 17 years the United States Government has used "ANTI-HYDRO" in the Navy and other departments. Architects, engineers and builders everywhere use "ANTI-HYDRO" because of its economy and guaranteed results.

Because it is a liquid integral compound, "ANTI-HYDRO" is extremely easy to use. Simply mix it with the water used in wetting down concrete. Any unskilled laborer can do it. Saves finishers' time, too, because it accelerates the set of concrete and eliminates costly overtime work.

For 25 years "ANTI-HYDRO" has proved its reliability on every type of concrete hardening and waterproofing work. Use it on your next job for economy and guaranteed satisfaction.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. A carload of details can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

Stone, steel, 2½ stories and basement, 48x40 feet, garage 25x32 feet, hot water heat, oil burners, electric light, metal lath, tile, steel casement windows, ornamental iron work, slate roof, oak and yellow pine floors, cement floors, plumbing.

Club House, West Chester, Chester County, Pa. Contract awarded Claro Construction Co., Presser Building, Philadelphia. Architect, William Corcoran, 130 East Biddle street, West Chester, Pa. Owners, Levi M. Hood Lodge, No. 159, B. P. O. E., 314 East Gay street, West Chester, Pa. Brick, steel, cast stone, 4 stories, 40x120 feet, built-up roof, steam heat.

Residence and Garage, School Lane, Lancaster, Pa. Contract awarded Herman Wohlson, Woolworth Building, Lancaster, Pa. Architect, M. R. Evans, 10 South Queen street, Lancaster, Pa. Owner, Robert H. Evans, care of architect. Brick, concrete block, 2½ stories, 55x60 feet, slate roof, hardwood and linoleum floors, oil burner, electric light, tile, incinerators.

Club (add.), Reading, Pa. Contract awarded Fink Construction Co., 510 Walnut street, Reading, Pa. Architect, F. A. Muhlenberg, Ganster Building, Reading, Pa. Owners, Wyoming Club, care of architect. Brick, steel, 3 stories, 40x50 feet, 52x40 feet, slag roof, hardwood floors, electric light.

Steward's Residence, Laurelton, Pa. Contract awarded O. P. Bell, Sunbury, Pa. Architect, George S. Idell, 1510 Chestnut street, Philadelphia. Owners, Laurelton State Village, Laurelton, Pa. General alterations and add.

Grade School Building, Northwest side Cedar road, East of Gibson avenue, Fox Chase Manor, Pa. Contract awarded. Architects,

Druckenmiller & Williams, 112 South Sixteenth street, Philadelphia. Owners, School District of Abington Township, Mr. Charles M. Doll, Secretary, Abington, Pa. Brick, reinforced concrete, steel, 1 story and basement, 156x56 feet, excavation, bond, reinforced concrete and cement work, cinder concrete block, marble work, (exterior) limestone, granite, bluestone, gypsum partitions, tile, dampproofing, floor hardener, caulking, structural steel, kalamein floors, fire doors, maple floors, linoleum floors, metal trim, metal toilet stalls, metal lath, plastering, painting & glazing, composition floors, slate roof (plumbing, heating, electric separate). Frank Seraski, Brown's Mills, N. J., \$63,275. Plumbing, Fred Wackenhut, 2416 Frankford avenue, Philadelphia, \$3,675. Heating, American Heating & Ventilating Co., 1505 Race street, \$6,315. Electric, Mitchell & Co., 1337 McFerron street, Philadelphia, \$1,997.

Residence and Garage, Bryn Mawr, Pa. Contract awarded E. R. Hall, 34 South Seventeenth street, Philadelphia. Architects, Tilden, Register & Pepper, 1608 Walnut street, Philadelphia. Owner, W. S. Maddox, Fidelity-Philadelphia Trust Building, Philadelphia. Stone and steel, 2½ stories and basement, 82x150 feet, hot water heat, electric light, tile work, bond, steel casement windows, ornamental iron work, slate roof, oak and yellow pine floors, plumbing, carpentry and mill work, excavation, hardware.

Bulk Plant, West Chester, Pa. Contract awarded Lutz Construction Co., Twenty-third and Chestnut streets, Philadelphia. Architect, private plans. Owners, Standard Oil Co., A. M. Holler, Public Ledger Building, Philadelphia. Concrete and hollow tile, 1 story, irregular sizes, excavation, concrete and cement work, brick, overhead doors, kalamein floors, hardware and iron work, slag roof, damp-proofing, plumbing, steel sash, metal toilet partitions, linoleum floors, electric, plumbing, steam heating, septic tanks.

Road Work, Pennsylvania. Contracts awarded. Owners, Pennsylvania Department of Highways, Harrisburg, Pa.

Montgomery County, R-198, Lower Moreland Township. One course reinforced concrete. Suburban Construction Co., Ardmore, Pa., \$77,286.88.

Chester County, R-541, Highland and East Fallowfield Townships. Grading and drainage. Dalton Brothers, Paoli, Pa., \$84,891.39.

Crawford County, Sec. 2, Wayne Township. One course reinforced concrete. Grading and drainage. J. C. Devine Co., Meadville, Pa., \$151,136.77.

LIBRARY BUILDING
at
WEST VIRGINIA UNIVERSITY
Morgantown, W. Va.

NOTICE TO CONTRACTORS

Sealed bids will be received by the State Board of Control at its office in Charleston, W. Va., until 2.00 P. M., Wednesday, November 27, 1929, for doing all work and furnishing all materials necessary to complete the building described below, according to the plans and specifications of Davis, Dunlap & Barney, Architects, 1805 Walnut Street, Philadelphia, Pa. Separate bids are required for the general construction, for heating and ventilating, for plumbing and for electrical work.

The building occupies an area of 151 feet 6 inches by 118 feet 2 inches, and consists of a Ground Floor, First Floor and Second Floor, and a Fan Room and Warm Air Ducts under the ground floor.

The Ground Floor contains the Administration Offices, the seminars and studios, toilet rooms, storage and bindery, unpacking room, and the janitor's work spaces.

The First Floor contains the General Reading Room, Assignment Reading Room, General Delivery Room and Catalog Work Space.

The Second Floor contains the Periodical Room and unfinished portions for the future Graduate Reading Room, Special Reading Room, seminars and toilet rooms.

The Stack Room extends from the Ground Floor up to the underside of the Second Floor. The elevator hatch extends from the Ground Floor to the Pent House.

The central portion of building is of steel skeleton construction.

Generally, the first floor construction is of reinforced concrete beam and slab construction.

tion. Rear portion is of steel beam and reinforced concrete slab construction.

The second floor and main roof construction is of steel beam and girder and reinforced concrete construction. The other portion of roof and floor construction is a composite steel and reinforced concrete beam and girder and reinforced concrete slab construction. A temporary plank and slag roof is to be placed over the main roof slab.

The building also consists of reinforced concrete footings and foundation, brick walls with cut stone trim, cement floors, terrazzo floors, cork tile and linoleum floors, composition floors, metal stairways, metal sash, interior marble work, interior wood finish, plain and ornamental plastering, waterproofing, painting and decoration, roofing and sheet metal work, hardware and elevator equipment. No book stack equipment.

Heating and Ventilating includes Hot Water Heater, ventilating units, Aerofin units, fans and motors. Heat of steam from Central Plant.

Plumbing includes drainage, hot and cold water supply, gas supply and plumbing fixtures.

Electrical Work, conduit, wiring, switchboards and panel boards, telephone system, fire alarm system, buzzer system and lighting fixtures.

Plans, specifications and blank form for bids will be mailed to GENERAL CONTRACTORS by the State Board of Control when request is accompanied with check in the amount of Fifty Dollars (\$50) which amount will be refunded only on receipt of bona fide bid and the return of the plans and specifications.

Plans, Specifications and blank form for bids will be mailed to Mechanical Contractors, Heating, Plumbing and Electrical Work, when request is accompanied with check in the sum of Twenty-five Dollars (\$25), which amount will be refunded only on receipt of bona fide bid and the return of the plans and specifications.

Certified check in the amount of 1 per cent of the bid made payable to the State Board of Control must accompany the bid, and same will be returned to all unsuccessful bidders immediately after opening.

Surety bond will be required of the successful bidders, according to our law in full amount of the contract price.

STATE BOARD OF CONTROL
By James S. Lakin, President,
Charleston, W. Va.

TERMITES IN BUILDINGS

By THOS. E. SNYDER, *Senior Entomologist, Division of Forest Insects, Bureau of Entomology*

Where and What Are Termites?

People sometimes think that termites live only in tropical countries. This is a mistake. They are in the United States and are destructive wherever you find them. In the Southeastern, Central, Western, Southwestern, and Pacific Coast States, however, their damage to the woodwork of buildings is especially bad.

Termites are not true ants, although they look much like them and live in large colonies made up of different forms. The winged male and female termites which you see "swarming" for a short time in the spring or fall are on their way to start new colonies. These parent termites are not injurious, but their descendants, the wingless workers of the new colony, are very destructive. These you rarely see, because they do not crawl about in the open but stay in the earth underground or in the wood. If they want to reach woodwork above ground, they build earth-like tubes to crawl through. So they are always under cover.

How Termites Damage Buildings

Termite damage is always hidden inside the wood. The interior rafters, joists, beams, or other timbers of a building may be entirely eaten out before the insect vandals are noticed, since they leave a protective outer shell. Such damage is then hard to repair.

The termites which do the greatest damage to buildings and their contents, especially by weakening the supporting timbers, are those which live in the ground and attack wood indirectly from the ground. These ground-nesting termites cannot live without moisture, and this they get from the earth. If shut off from moisture in the earth they dry up and die.

How Termites Get Into Buildings

If your house is built in such a way that termites can get in, they very likely will. It will not do to use wood in basements, or in the foundations of buildings, because these are the places where termite damage is most likely to start.

Termites are able to penetrate masonry walls where improper grades of mortar have been used in foundations, working up through the interior of walls.

By means of earthlike shelter tubes, termites are also able to crawl up through them over impenetrable walls and thus infest buildings.

These are the principal means by which termites get into buildings.

Protection of Basement Construction Essential

Irrespective of whether the proposed building, as to its main construction, is to be of masonry or wood, it is highly desirable, where practicable, to eliminate wood from foundations, cellars, and basements. This means the substitution for wood of concrete or other stone equivalent for basement floorings, as well as the elimination from basements of any other structural wood, including wood substitutes, such as fiber and composition boards and other substitutes containing cellulose. This prohibition does not apply to movable furniture.

Timber or lumber can be used safely in buildings if it is raised above possible soil contact a suitable distance by rock, concrete, or brick foundations, made with standard grades of mortar; or if suitably capped and if metal shields are put on to shut off passage tubes.

Cost of Termiteproofing Slight

A few hundred dollars additional (2 per cent of the first cost) spent in the beginning in proper building construction may save you thousands of dollars in repairs and replacements later. It is much simpler and cheaper to keep termites out of a building than to get rid of them and repair the damage after they are once in. The necessary repairs may be too costly for the small householder. But certain methods of construction that will prevent injury are entirely practical.

How to Build Properly Where Wood Is Used

Here are some suggested regulations for preventing termite attack which should be made a part of city building codes:

Wood or fiber products, when an approved preservative has not been forced into the product, shall not be placed in the earth or within 18 inches thereof, excepting wood columns or posts over a concrete floor, which columns shall be provided with noncorroding metal or concrete base plates or footings 6 inches above the floor. This applies to steps, which shall be laid over a concrete base, projecting at least 6 inches beyond the supports of the steps.

Timber to be used in contact with the earth shall be thoroughly impregnated by a standard-pressure process with coal-tar creosote or other equivalent preservative. Timber should be completely cut to proper dimensions before treatment, whenever possible, but when cutting after treatment is unavoidable the cut surfaces shall be thoroughly coated with coal-tar creosote or other equivalent preservative.

Masonry foundations and footing shall be laid in Portland-cement mortar. Foundations built up of masonry units, whether hollow or solid, shall be capped below woodwork with at least 1 inch of Port-

land-cement mortar, or the mortar and slate, or solid or joined noncorroding metal, or other equally efficient seal.

In the case of frame buildings, a metal termite shield shall be provided, continuing completely around the top of the masonry foundation, including all pillars, supports, and piping, below the woodwork of the building, on both the inside and outside surfaces. Such a shield may be formed of a strip of noncorroding metal (such as copper, or zinc, or an alloy composed of 28 per cent of copper, 67 per cent of nickel, and 5 per cent of iron, manganese, and silicon), firmly inserted in the surface of the masonry, or between the foundation and the wood, with the projecting edge bent downward at an angle of 45° and extending horizontally at least 2 inches from the face of the foundation. In masonry buildings this shield can be inset in the masonry at a height at least 18 inches above the ground.

Floor sleepers or joists imbedded in masonry or concrete, or laid on concrete which is in contact with the earth, shall be impregnated with an approved preservative.

Expansion joints between concrete floor and wall shall be filled with liquid asphaltum and the right-angle joint covered with a sanitary cement mortar or Portland-cement concrete finish of an arc of at least 2 inches in length.

The ends of wooden beams or girders entering masonry or concrete shall not be sealed in but shall be provided with boxes affording an air space at the end of the piece of not less than 1 inch at side of member, unless the ends of such timbers are impregnated with coal-tar creosote or other approved preservative.

Where there are spaces under floors near the earth, they shall be excavated so that there will be no earth within 18

inches of the wood, and they shall be provided with cross ventilation. Such ventilating openings shall be proportioned on the basis of 2 square feet for each 25 lineal feet of exterior wall, except that such openings need not be placed in front of such building. Each opening shall be provided with 20-mesh noncorroding-metal screening, including windows in attics.

Where timber is used in roofs of the flat type, the roof shall, unless protected on the weather side with a waterproof covering, have a slope and runoff sufficient to provide proper drainage.

All wooden forms on foundations shall be removed from masonry work within 15 days; grading stakes shall be removed before laying concrete floors.

How to Locate Damage

At once look over carefully all woodwork touching or near the ground to find out how the termites got in. Discover where the flying forms came out of the woodwork. This will indicate where the workers are in the wood. Often you will find large numbers of dead winged termites or the shed wings near by.

When you try to stop further damage by termites in buildings you should realize that their numbers may be constantly increased from some undiscovered, outside nest. Killing the swarming winged adults, although it may prevent the founding of new colonies, will not stop the damage to the woodwork by the workers inside.

Another warning that termites are around is the branching shelter tubes on foundation timbers or other woodwork, or reaching from the ground to the woodwork over the surface of stone, brick, or other foundation material through which the termites can not burrow.

Remedies the Same as Preventives

In repairing termite-damaged buildings use the same suggestions as for the construction of new buildings. If you do so you can get rid of termites in buildings where they are already working.

Disconnecting Wood from the Ground

You will save time and expense if you disconnect the woodwork from the ground. Especially will this be so in the case of old frame buildings where extensive repairs would not be practicable. When you disconnect untreated foundation timbers from contact with the soil the termites in the other woodwork, furniture, and stored material in the building will also die, even if they have reached the second or third floors. Timbers structurally weakened so as to endanger the buildings, or disfigured woodwork, of course should be removed. However, if the wood is kept moist by some other means, such as water leakage, the termites will continue to work. This applies especially to damp corners of basements near outside water pipes, bathrooms, kitchens, and the like.

Wooden floors laid directly on the ground or on tar, or tarpaper, or on the beams on the ground, or set in concrete, should be removed. There should be a layer of concrete, or of other artificial stone effectively sealed with proper mortar or concrete, between the earth and the wood.

Capping and Facing

A frame building need not be raised or jacked up to cap the wall, but the upper tier of bricks can be removed, a few at a time, and the wall capped.

Where poor grades of mortar have been

used in masonry walls below the ground, it may be necessary for you to coat the outside or inside of the wall with Portland cement or concrete to keep termites from boring through.

Metal Termite Shields

Termite shields of metal can be inserted over the masonry foundations of buildings already constructed.

For a more complete description of termites and their habits, see Farmers' Bulletin 1472, U. S. Department of Agriculture.¹

¹ Snyder, T. E. Preventing Damage by Termites or White Ants. U. S. Dept. Agr. Farmers' Bul. 1472, 22 p., illus. 1926.

SAFE BUILDING CONDITIONS

Mr. Max Baumann of the Committee on Accident Prevention in the Building Trades Employers' Association, New York, recently made some interesting observations on safety conditions in building operations in Europe.

"The method of constructing exterior scaffolds in Europe is a system that we eliminated years ago. This is true of Italy, Switzerland, Czecho-Slovakia, Austria, Germany, Holland, France, and some parts of England, all of which countries I visited in my travels and naturally investigated building conditions. Contractors in these places are still building the pole type scaffold with the rope lashings. In London, however, they are using our latest type of pipe scaffold.

"In some of these countries, as Italy, the authorities make the contractor cover the entire front of the building under

erection with a mesh of reeds so that the facade is not exposed. In the other cities they have very little if any protection around their scaffolds except in London, where they use the foot board. London was the only place that I saw any hanging scaffolds such as we use here in New York and they are few in number.

"In England most of the construction work on tall buildings is done from the inside of the structure, but whether from the inside or the outside the scaffolds are built from the ground up.

"The interior scaffolds that I saw, particularly in some churches in Germany, are terribly flimsy. In Cologne they were repairing the Cathedral and it is still a mystery to me how the stone masons and stone cutters ever got their material up to the high points, where they were working, without an accident.

"In Paris they have very poor scaffolds and the derricks are exceedingly small and most of them are operated by hand power. Reinforced concrete is invariably used.

"In Berlin, during the erection of a recently completed department store, there were a great number of fatal accidents in the steel and concrete construction, owing to the lack of protection for the men. This is a structure 200 feet wide by 800 feet deep by 10 stories high. I was told they have a very severe accident rate on steel work. Berlin, though, is the most beautiful, cleanest and best built city in Europe.

"There are lots of four-story apartment houses going up in Vienna. They are up to date in equipment and I was surprised to see how modern their construction is when I made an inspection of one garden group that will eventually house 20,000 people. It must extend for a mile and is being financed by the Government. All are of stucco. Vienna has not recovered from the war. Her people are poor, but they are industrious. It is a wonderful city.

"In Italy all the new buildings are fire-resisting, being built of concrete, terra cotta and brick.

"Very little American material is imported by the European countries as they have their own terra cotta and cement mills and other material plants."

The rapid progress being made toward three objectives of organized contractors, involving the development of a sound credit structure for the construction industry, the recording of the performance records of all contractors and the standardization of terms of sale for equipment, will be the chief items on the program of the forthcoming meeting called by the Associated General Contractors of America at the Bond Hotel, Hartford, Conn. This was just announced by D. A. Gar-

ber, General Manager of the contractors' organization.

The first of these objectives, according to Garber, concerns the formation of local credit associations which are being created to eliminate loose credit conditions in the building industry. In fifty cities credit bureaus are being formed through the co-operative work of general contractors, sub-contractors and material dealers, although the plan being followed was only formulated last year.

The success attending the application of the credit plan in Detroit, Memphis and Los Angeles, which cities undertook to prove that the tremendous credit losses and attending competitive ills of the industry could be corrected through sound credit practices, have aroused nation-wide interest, it is said.

Consideration will be given to ways and means to assist the Bureau of Contract Information, Inc., an independent venture launched through co-operative action of the A. G. C. and organized surety companies. This agency is gathering the facts concerning the past performance of every contractor in the United States so that public officials and others may know the records of bidders when awarding construction contracts.

The third item on the program, which is stressed by Garber, concerns the co-operative work under way between equipment manufacturers and the A. G. C. to the end that agreed upon sales practices will be observed by equipment companies.

Standard terms of sale have been adopted by fifty of the leading manufacturers due to the promotion work of the contractors' association. It is claimed that the results are already being felt in the elimination of special easy terms once given to individual contractors who were not entitled to consideration.

At the Hartford meeting the Executive Committee, the Executive Board, the Advisory Council and the Secretaries' Council of the A. G. C. will go into session to plan for further development of these and other objectives of the organization. As in previous meetings all contractors and others connected with the industry are being invited. Open sessions only are held.

MEETING OF SIMPLIFIED PRACTICE COMMITTEE ON MASONRY OPENING SIZES, ADDRESSED BY SECRETARY OF COMMERCE, ROBERT P. LAMONT. SUB-COMMITTEE APPOINTED TO DRAFT TENTATIVE RECOMMENDATIONS PROPOSING A MASONRY UNIT

"Economy in the building and construction industries is more necessary now than ever before," says Secretary of Commerce, Robert P. Lamont, in an in-

formal address of welcome to the members of a Simplified Practice Committee on Masonry Opening Sizes, at a meeting held recently at the Dept. of Commerce, Washington, D. C., under the auspices of the Division of Simplified Practice, National Bureau of Standards, Department of Commerce.

Outlining the services which the Department of Commerce has to offer the industries in the matter of the elimination of industrial waste and making for better economy in building operations, Mr. Lamont stated that, "it is often necessary for the component elements of an industry to compromise on questions of minor importance in order that they may effect simplification or commercial standards programs which will be of benefit to the whole industry as well as to the entire country." Mr. Lamont further stated that "the Department of Commerce, through its Division of Simplified Practice of the Bureau of Standards, is ready to support industry on any program that meets with the approval of the majority of that industry."

It was the consensus of opinion of those present, in discussing the subject of a standard unit dimension for masonry, that the fundamental or "Key" building unit was embodied in the brick. It was accordingly suggested that a brick plus a mortar joint be established as a unit of measure, the length of the brick to equal a unit minus one joint; the width one-half unit minus one joint; and the thickness being 1/3 unit minus one joint. For the purpose of these considerations a mortar joint was taken to equal one-half inch.

Mr. LeRoy E. Kern, representing the American Institute of Architects, who was elected chairman of the Simplified Practice Committee announced that he will shortly appoint a sub-committee which will consist of one representative each from the Face Brick Manufacturers, the Common Brick Manufacturers, and the Associated General Contractors of America. It will be the duty of this sub-committee to prepare a report in the form of a recommendation as to some standard dimensional unit, such as suggested at the conference held in Washington. This recommendation, necessarily tentative in its nature, will subsequently be referred to all those interested in the subject for their consideration and criticism.

"LIGHTING OPERATOR" IN FRONT OF CURTAIN CONTROLS THEATRE LIGHTS

A new system of controlling the lights of a theatre, involving new and unique principles and minimizing time, labor and valuable space, has been developed by the General Electric Company and installed in the new Chicago Civic Opera

House. The Lighting director (usually the stage electrician), heretofore unseen to the audience but vitally important to the success of the production, now leaves his position back-stage for the first time in theatrical history, and takes his place in front of the curtain along with the prompter and the musical director.

In front of the curtain, the lighting operator will control the stage and house lighting as easily and as intelligently as the orchestra conductor now directs the orchestra. In front and on each side of him will be arranged dials, knobs, tumbler switches, indicating lights, etc. By the mere manipulation of a single knob all the complexities of stage lighting will be controlled, lights of various colors fading and brightening at various points and at the proper moments. Scenes requiring complex lighting effects such as sunsets, sudden thunderstorms, ballets, etc., will require no more effort in their control than is required to flick a lighting switch in the home or to turn a door knob.

The advantages of the new method are manifold. Heretofore, the control of theatre lights was centralized in a switchboard back-stage which, in the larger theatres, sometimes was 40 feet long by 8 feet high. Arranged on this switchboard were rows upon rows of "dimmers" with large levers whose movement controlled the brightening or dimming of the various lights or groups of lights. The operation of these dimmers required much physical effort and agility, and many elaborate and ingenious mechanical schemes were often resorted to in order to simplify the work. Their manipulation made it necessary for the electrician to be at a point "off-stage" where he could not see, except indirectly, the effects he was producing and where he had to rely on cues of words or sounds to inform him when it was necessary to change the lighting effects. Such a switchboard is no longer necessary.

The new method also follows the modern trend which makes simplicity an essential, especially in theatres. By eliminating the old bulky switchboard in the wings, more space is made available to stage operations, and co-ordination of activities results.

The General Electric control scheme which makes the new method possible involves principally the use of three important devices: the self-synchronous motor, the low-vacuum rectifying tube marketed under the trade name of "thyatron" and a new type of saturated-core reactor. Reactors have been used before in stage lighting but a new type had to be designed to fit the new system.

The selsyn is a device resembling an ordinary electric motor in appearance and general construction. Contrary to the

operation of a motor, however, the rotating element does not revolve at a high rate of speed, but moves slowly—rarely more than a complete revolution. When two selsyns are interconnected electrically, the movement of the rotating element of one produces a corresponding movement of the other rotating element in the same direction and by exactly the same amount. It is by the use of these devices that the operation of the Panama Canal locks is controlled, and they are also used in this country for various purposes including the opening and closing of bridges, operation of elevators, etc.

One side of the voltage supply to each light or group of lights passes through one winding of a saturated core reactor. The other winding of this reactor is fed by direct current in varying amounts from a pair of thyratrons. The amount of rectified current supplied by these thyratrons depends on the electrical relationship between the elements of each tube, and this is determined by the control devices governed by the lighting operator. As the amount of direct current fed by the thyratrons to the reactor varies, the resistance of the reactor to the lighting supply load varies from a point where the lights are out, to full brilliancy.

The immediate determination of the relationship of the elements of the thyratrons is through the agency of devices called phase modulators. There are two of these for every individual lighting circuit, one for use during the present scene and the other for the purpose of "setting up" the next scene. The operation of the modulators is, in turn, governed mechanically either by the action of a selsyn or by knobs in front of the lighting operator.

By manipulating the knobs on the individual modulators, the lighting operator could control the lights, but it would involve the operation of a possible 141 knobs in the case of the Chicago Civic Opera House, as there are that many lighting circuits on the stage. By the use of the selsyns, however, it is possible to govern all the lighting circuits through one knob, or to split the control into major and minor divisions, depending on color, location and function, each group in turn controllable through the agency of a knob. This is done in the following manner:

The grand master knob controlling all the lights on the stage electrically controls the movement of the rotating element of a grand master selsyn. This selsyn is electrically connected with selsyn governing not only the major and minor groups of lights, but also the individual modulators for single lighting circuits. Therefore, movement of the ground master selsyn's control knob causes all the selsyns operating the modulators to move in conformity with it, and the modulators, preset in accordance with the requirements of the scene, operate to

control the lights. If, however, individual control of any major or minor group or individual lighting circuit is desired, the knob in question may be turned and the resulting movement does not interfere with any of the other circuits.

There are 141 individual stage lighting circuits in the new Chicago Civic Opera House. Each of these circuits includes lights of but one of the four colors used on a theatre stage—amber, white, blue and red. A typical circuit may cover the amber lights at one side or the center of the footlights, the red lights in one of the light bridges, or the white lights in one of the "pockets." These individual circuits are grouped under the control of master knobs governing, for example, all the blue lights in the borders and footlights, all the amber in the pocket lights, all the white in the light bridges, etc. In addition, all the lights of each color, no matter where, are controlled by a color master knob. Finally, all the color master knobs can be group controlled by the grand master knob. The same system is followed with the "house" lights of the theatre, but in a much simpler form as the lighting circuits involved are comparatively few.

The energy involved in the control of any of the individual lighting circuits is approximately one-tenth that consumed by a pocket flashlight. The energy controlled, however, runs as high as 30,000 watts in a given circuit—more than half as great as the power ratings of the largest broadcasting stations in this country.

In actual operation, the lighting operator will preset the individual modulators to create the desired lighting effect in the first scene and, when the performance starts, the modulators will be connected in the circuit by means of a master tumbler switch. Varying the intensity of the lights will then be merely a matter of turning the grand master knob, or other knobs as desired. During the first scene and in the interval between it and the following scene, the lighting effects for the subsequent scene will be preset at the modulators by the lighting operator and, when the change occurs, the first group of modulators will be disconnected from the circuit and the second connected in the circuit simply by a flick of the master tumbler switch, when operation will proceed as before.

The lighting operator and his control devices will be located in the Chicago Civic Opera House, in a booth similar to and near the prompter's booth, enabling him to see all the lighting on the stage, and a periscope through which he can see all the lighting in the auditorium proper. All the selsyns and modulators will also be located at this point, but will occupy very little room as they are compactly built. The reactors will be mounted on frames at remote points where there is room, such as beneath the

stage or on the "grid" level high above the flies. The wiring to the lights will be arranged as heretofore.

DON'T LET COMPETITORS DICTATE YOUR BID

"When we contractors give competition so much consideration that we let competitors dictate bid pricing, we are far in the wrong," was the gist of the message delivered by George C. Hunt, former president of the Associated Contractors of South Dakota, on the occasion of his annual address to the organization.

"The thought that you usually carry to a letting is, 'Who are the contractors figuring this job—and how hard is Henry or Walter going to hit it?' Then you say, 'They are here, and they can do this work for four per cent, then so can I'—knowing all the time that you have an overhead of six per cent, but still hoping against hope that you will find something in the job that will help you out.

"You fellows may lose a job now and then, if you figure your own work, but eventually you are going to impress the others with the fact that you have adopted a policy and you are going to stick to it, and they too will soon be doing the same thing. Then the time will come, when you will have to have only three contracts each year to make an honest living instead of six as it the case now. Always remember that you cannot do work any cheaper than the others unless you do it cheaper, and who wants to do cheap work, either in workmanship or in price?"

—The Associated Contractor.

Many a man would do a better job if he didn't know about putty.—Ex.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

The only road to advancement is to do your work so well that you are always ahead of the demands of your position. Our employers do not decide whether we shall stay where we are or go on and up; we decide that matter ourselves. Success or failure is not chosen for us; we choose them for ourselves.—H. W. Mabie.

You owe it to yourself to keep in touch with what is going on in the trade, and you can do this only by becoming a subscriber to and regular reader of your trade paper. If you are not a regular reader of the Builders Guide you should be. The cost is not excessive. A ten spot insures it fifty-two times in the course of a year.

America stands supreme in the development and use of advertising, and advertising is the seed which by implanting desire produces the fruit of social advancement. Education promotes efficiency and efficiency in turn makes possible higher earning power, higher purchasing power and improved living conditions.

This Stucco House Is Always Dry—

It's Waterproofed with "ANTI-HYDRO"

The interior of this stucco house is always dry because it is permanently waterproofed with "ANTI-HYDRO." The exterior will never chip, craze or map-crack because "ANTI-HYDRO" has also hardened it. And the rich buff colored stucco will not fade or stain because the use of "ANTI-HYDRO" insures uniform color.

By hardening and waterproofing stucco with "ANTI-HYDRO" you preserve the beauty of your jobs indefinitely and eliminate patching and repairs after the building is completed.

"ANTI-HYDRO" is easy and economical to use. It is a liquid which mixes readily with the water used to wet down stucco. It enriches stucco and makes it stick firmly to walls and prevents sliding. Workmen can plaster 50 per cent more surface in the same time as they can using plain cement mortar. "ANTI-HYDRO" makes stucco bond secure to tile, brick and concrete. When applied on metal lath it protects the lath against rusting. Used with any dry mortar color or white cement and sand without dimming or changing the color.

"ANTI-HYDRO" results are guaranteed satisfactory and backed by a 25-year reputation for permanence. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., October 17, 1929. Sealed bids will be opened in this office at 3 p. m., November 18, 1929, for repairs and remodeling (except elevator) of buildings at 223-227 Chestnut Street for the U. S. Marine Hospital at Philadelphia, Pa. Drawings and specifications, not exceeding six sets, may be obtained at this office in the discretion of the Supervising Architect by any satisfactory general contractor, and provided a deposit is made of \$15 for each set to assure its prompt return. Checks offered as deposits must be made payable to the order of the Treasurer of the United States. JAS. A. WETMORE, Acting Supervising Architect.

The man with an order to place doesn't hunt you up in the city directory these days. He hasn't the time. If he can't find you in your trade magazine he can and does find somebody else, and that somebody else books the order.

INDUSTRY AS A WHOLE REPORTS GAIN OVER LAST YEAR BUT EIGHT INDIVIDUAL INDUSTRIES SHOW DECLINE

Annual Trade Survey of the National Association of Manufacturers Indicates Slight General Betterment But Numerous Groups Reveal Disturbing Situations at the Present Time

Industry throughout the country at the present moment is just a shade more favorably situated than it was a year ago; but numerous individual industries show distinct recessions from their position last year and present a somewhat disturbing tone to the general picture, according to the annual trade survey of the National Association of Manufacturers, presented at the annual meeting by J. Lewis Benton, general secretary of the organization.

A questionnaire, covering present trade, prospects for winter, comparison with last fall, production, sales quantities and values, employment, wages and labor conditions, was sent to three thousand members of the association the first of this month, with request that the report be made as of October 4. The tabulation was closed October 7 at which time nearly 1,000 replies had been received. The survey covers a compilation of something more than 9,000 detailed answers, and presents the picture of business of the

last fortnight.

Taking the industries as a whole, of the companies reporting, 19 per cent class their present business as excellent; 45 percent good; 31 per cent fair and 5 percent poor. Last year they were classified, 17 per cent excellent; 41 per cent good; 34 per cent fair; 6 per cent poor. Prospects for the winter are regarded as excellent by 12 per cent; good by 54 per cent; fair by 30 per cent; poor by 4 per cent; while last year 14 per cent reported excellent; 43 per cent good; 36 percent fair and 6 per cent poor.

Comparing the business done up to this fall with the same period last year, 53 per cent report better returns; 17 per cent less and 30 per cent find no change. A year ago the report was 50 per cent better; 25 per cent less; 25 per cent no change.

Production as compared with last fall is reported increased by 74 per cent. of the companies as against 65 per cent last year; decrease by 26 per cent; increased sales quantities are reported by 73 per cent as against 65 per cent last year; increased sales values by 64 per cent as against 52 per cent last year. Depleted stocks are reported by 14 per cent this year as against 16 per cent last year; normal by 78 per cent this year as against 74 per cent last year; and over by 8 per cent this year as against 10 per cent last year.

Increased employment is reported by 69 per cent of the companies, decreased by 31 per cent; increased wages are re-

ported by 91 per cent, decreased by 9 per cent, while 23 per cent of the companies report a shortage in skilled workers. One healthful thing is that labor troubles have been practically eliminated, the percentage of companies reporting no strikes being 99.74 and of those reporting strikes .26—less than one-fourth of one per cent.

Going into the individual industries, some unfavorable reflections appear. Twenty-three classifications of the basic industries are covered in the survey. Of these, twelve report gains that in some instances are slight and in other instances might be considered excellent advances. These twelve are clothing; electrical; farm products and foodstuffs; glass; crockery and porcelain; hardware and tools; iron foundries and machine shops; jewelry; leather, machinery, paper and pulp; stationery and printing; miscellaneous. Three industries seem to have just about held their own, building supplies; textiles and metals. Eight industries show a shading off. These are automobile accessories; chemicals; furniture; iron and steel; lumber; paints; oils and varnishes; rubber; ceramics. Lumber and ceramics take a rather gloomy view—not one company of either industry reports present business as excellent, nor does a single one consider prospects for the winter in the excellent category. Furniture and rubber reports show not one company classing prospects for the winter as excellent.

Reports on the individual industries follow:

Automobiles and Accessories

Present trade conditions are reported excellent by ten per cent of the companies; good by 38 per cent; fair by 48 per cent and poor by 4 per cent. This is a shading off from last year, as the same group reported 25 per cent. having excellent business; 40 per cent. good business; 34 per cent fair, and 1 per cent

poor. As to prospects for the winter, 14 per cent report excellent; 55 per cent good; 31 per cent fair and none poor. Production, compared with last fall has increased in 67 per cent of the replies and decreased in 33 per cent. Sales quantities are reported increased by 76 per cent and decreased by 24 per cent; sales values, as compared with last fall, as increased by 59 per cent and decreased by 41 per cent. Stocks on hand are reported low by 8 per cent, normal by 88 per cent and over by 4 per cent. Sixty-eight per cent of the replies report increased employment over last fall and 32 per cent report decreases. Eleven per cent of this group report a shortage of skilled labor, two per cent report a shortage in unskilled. Seventy-seven per cent report slight increases of wages and 23 per cent report small decreases. None have had labor troubles.

Building Supplies

Present trade is reported excellent by 9 per cent; good by 34 per cent; fair by 48 per cent; poor by 9 per cent. This is about even with last reports, 5 per cent reporting excellent; 47 per cent good; 38 per cent fair; 10 per cent poor. Prospects for the winter are regarded excellent by per cent; good, 29 per cent; fair, 38 per cent; poor, 24 per cent. Production compared with last fall is reported increased by 52 per cent, decreased by 48 per cent; sales quantities increased by 53 per cent, decreased by 47 per cent; sales values increased by 41 per cent, decreased by 59 per cent; stocks on hand, low 14 per cent, normal 71 per cent and over 15 per cent. Forty-two per cent report increased employment, 58 per cent decreased; six per cent report shortage in skilled labor; 71 per cent report increased wages, 29 per cent report decreases; no labor troubles.

Ceramics

Present conditions are regarded as excellent by none of those reporting; good

by 50 per cent, fair by 12 per cent and poor by 38 per cent. Prospects for the winter are regarded as excellent by none, good by 38 per cent; fair by 37 per cent; poor by 25 per cent. Production compared with last fall is reported increased by 40 per cent, decreased by sixty per cent; 34 per cent report increased sales quantities, 66 per cent decreases; 17 per cent report increased sales values and 83 per cent decreases; stocks on hand are low in 12 per cent of the replies, normal 63 per cent, over 25 per cent. Forty-three per cent report increased employment, 57 per cent decreases; no labor shortage; wages have had slight increases in 50 per cent. of the companies reporting and decreases in the same percentage; no labor troubles.

Chemicals

Prevailing conditions are pronounced excellent by 17 per cent; good by 62 per cent; fair by 14 per cent; poor by 7 per cent. This also shows a slight falling off as last year the group reported 21 per cent finding excellent business, 58 per cent good, 17 per cent fair and 4 per cent poor. Prospects for the winter are regarded as excellent by 7 per cent; good by 68 per cent, fair by 21 per cent and poor by 4 per cent. Eighty-two per cent report increased production, 18 per cent decreases; 86 per cent report increased sales quantities, 14 per cent decreases; 75 per cent report increased sales values, 25 per cent decreases; stocks on hand are reported normal by 86 per cent, over by 14 per cent. Seventy-eight per cent report increased employment and 22 per cent decreases; no labor shortage; all report increased wages, 6 per cent classed as large increases and 94 per cent as small. No labor troubles.

Clothing

Present conditions are reported excellent by 23 per cent; good by 50 per cent; fair by 27 per cent; poor none. This is a little better than last year's reports which gave 15 per cent as reporting excellent; 50 per cent good; 25 per cent fair and 10 per cent poor. Prospects for the winter are regarded as excellent by 23 per cent; good by 50 per cent; fair by 27 per cent and poor by none. Production compared with last fall is reported increased by 65 per cent, decreased by 35 per cent; sales quantities increased by 66 per cent, decreased by 34 per cent; sales values increased by 50 per cent and decreased by 50 per cent; stocks on hand low by 14 per cent, normal by 81 per cent, over by 5 per cent. Employment is reported increased by 70 per cent, decreased by 30 per cent; while 72 per cent report increased wages and 28 per cent decreases. Twelve per cent report skilled labor shortage; no labor troubles.

per cent of the companies reporting business excellent; 55 per cent good; 5 per cent fair and none poor. Last year those reporting classed business, 16 per cent as excellent; 68 per cent good; 16 per cent fair; none poor. Prospects for the winter are regarded excellent by 30 per cent, good by 60 per cent; fair by 10 per cent and poor by none. Production compared with last fall is reported increased by 87 per cent of the replies, decreased by 13 per cent; sales quantities as increased in 85 per cent of the reports, decreased in 15 per cent; sales values increased in 79 per cent of the replies, decreased in 21 per cent; stocks on hand are reported low in 16 per cent; normal 82 per cent and over in 2 per cent. Increased employment is reported by 80 per cent; decreased 20 per cent; 13 per cent report shortage of skilled labor; 100 per cent report increased wages; no labor troubles.

Farm Products and Foodstuffs

This industry shows improvement. Of those reporting, 20 per cent class present trade as excellent; 49 per cent good; 31 per cent fair and none poor. Last year 10 per cent classed business as excellent; 40 per cent good and 50 per cent fair. Prospects for the winter are classed as excellent by 20 per cent; good by 60 per cent; fair by 20 per cent. Sixty-six per cent report increased production over last fall, 34 per cent decreases; 84 per cent report sales quantities higher, 16 per cent decreases; 67 per cent report increased sales values, 33 per cent decreased; stocks on hand are low in 15 per cent of reports, normal in 85 per cent. Seventy-eight per cent report increased employment and 22 per cent decreases; 25 per cent report labor shortage; all report slight wage increases; no labor troubles.

Furniture

There is a falling off in the general tone. Eleven per cent classify present business as excellent; 34 per cent as good; 55 per cent as fair. Last year the same group reported their conditions as excellent in 25 per cent of replies, good in 30 per cent, fair in 40 per cent and poor in 5 per cent. None put prospects for the winter in the excellent column; 62 per cent class them as good, 38 per cent fair and none poor. Production compared with last fall has increased in 73 per cent of the replies, decreased in 30 per cent; sales quantities have increased in 70 per cent, decreased in 30 per cent; sales values have increased in 67 per cent, decreased in 33 per cent; stocks on hand are low in 6 per cent, normal in 94 per cent. Employment as compared with last fall has increased in 72 per cent of the reports and decreased in 28 per cent; 15 per cent report skilled labor shortage; wages have increased in 90 per cent of the reports and decreased in 10 per cent; no labor troubles.

Glass, Crockery and Porcelain

Forty-two per cent of the companies report present trade as excellent; 25 per cent good; 33 per cent fair; none poor. This is an improvement over last year's reports, as at that time the same group reported, 25 per cent as finding business excellent; 42 per cent good; 25 per cent fair and 8 per cent poor. None of the companies sees excellent prospects for the winter, but 60 per cent class prospects as good; 32 per cent as fair and 8 per cent poor. One hundred per cent report increased production over last fall and increased sales quantities; 75 per cent of them report increased sales values but 25 per cent report decreases; stocks on hand are low in 25 per cent of the reports; normal in 67 per cent; no change in 8 per cent. All of the companies report increased employment; no labor shortage; and all report increased wages; no labor troubles.

Hardware and Tools

Shows improvement. Eighteen per cent of the companies report present trade as excellent; 43 per cent as good; 36 per cent fair; 3 per cent poor. Last year they reported, 17 per cent excellent; 40 per cent good; 40 per cent fair; 3 per cent poor. As to prospects for the winter, 15 per cent report excellent; 49 per cent good; 36 per cent fair. Production has increased in 91 per cent of the reports, decreased in 9 per cent; sales quantities have increased in 92 per cent, decreased in 8 per cent; sales values have increased in 72 per cent, decreased in 28 per cent; stocks on hand are low in 18 per cent, normal in 67 per cent, over in 15 per cent. Eighty-two per cent of the companies have increased employment, 18 per cent decreased; wages have been increased by all of them; 12 per cent report labor shortage; no labor troubles.

Iron and Steel

Shows recession from last year. As to present trade, 11 per cent report it as excellent; 45 per cent good; 42 per cent fair; 2 per cent poor. Last year the group reported 21 per cent excellent; 43 per cent good; 31 per cent fair; 5 per cent poor. Prospects for the winter are considered excellent by 8 per cent; good by 42 per cent; fair by 50 per cent. Production increases are noted by 74 per cent, decreases by 26 per cent; increased sales quantities are reported by 73 per cent, decreases by 27 per cent; increased sales values are seen by 67 per cent, decreased by 33 per cent; stocks are low in 8 per cent of the reports, normal in 84 per cent and over in 8 per cent. Increased employment is reported by 76 per cent, decreased by 24 per cent; increased wages are reported by 87 per cent, decreased by 13 per cent; 8 per cent report shortage of skilled labor; no labor troubles.

Iron Foundries and Machine Shops

Shows strong gain. Present conditions are reported excellent by 25 per cent; good by 34 per cent; fair by 38 per cent; poor by 3 per cent. Last year the same group reported business as, excellent 8 per cent; good 40 per cent; fair 36 per cent; poor 16 per cent. Prospects for the winter are considered excellent by 13 per cent; good by 48 per cent; fair by 36 per cent; poor by 3 per cent. Increased production is reported by 73 per cent, decreased by 27 per cent; increased sales quantities are reported by 70 per cent, decreased by 30 per cent; increased sales values by 70 per cent, decreased by 30 per cent; stocks on hand are low in 6 per cent; normal in 89 per cent; over in 5 per cent. Increased employment is reported by 66 per cent of the companies, decreased by 34; increased wages are reported by 96 per cent of the companies, decreased by 4

per cent; ten per cent report a skilled labor shortage; 2 per cent report strikes.

Jewelry

Fourteen per cent of the companies report present business excellent; 58 per cent good; 21 per cent fair and 7 per cent poor. Here is another slight gain as the same group last year reported 9 per cent finding business excellent; 48 per cent good; 43 per cent fair. Prospects for the winter are considered excellent by 21 per cent; good by 58 per cent; fair by 21 per cent. Production compared with last fall has increased in 77 per cent of the reports, decreased in 23 per cent; sales quantities have increased in 73 per cent, decreased in 27 per cent; sales values have increased in 82 per cent, decreased in 18 per cent; stocks on hand are low in 7 per cent of the reports, normal in 86 per cent and over in 7 per cent. Small employment increases have been made in 57 per cent of the companies, decreased in 43 per cent; wages have increased in 89 per cent of the companies, decreased in 11 per cent; 15 per cent report a shortage of skilled labor; no labor troubles.

Leather

Twenty-five per cent of the reports class present trade as excellent; 60 per cent good; 15 per cent fair; none poor. This is a gain over last year when the same group reported business as 17 per cent excellent; 25 per cent good; 41 per cent fair; 17 per cent poor. As to prospects for the winter, 15 per cent class them as excellent; 60 per cent as good; 25 per cent as fair; none poor. Production, compared with last fall is reported increased by 85 per cent, decreased by 15 per cent; sales quantities are reported increased by 73 per cent, decreased by 27 per cent; sales values are reported

increased by 63 per cent, decreased by 37 per cent; stocks on hand are low in 15 per cent of the reports, normal in 75 per cent, over in 10 per cent. Employment has been increased by 87 per cent of the companies, decreased by 13 per cent; wages have been slightly increased in 88 per cent, decreased in 12 per cent; 13 per cent report skilled labor shortage; no labor trouble.

Lumber

Shows a shading down. None of the reporting companies classifies present business as excellent; 28 per cent report good; 61 per cent fair; 11 per cent poor. Last year the group reported, 10 per cent excellent; 20 per cent good; 60 per cent fair; 10 per cent poor. None call the prospects for the winter excellent; 22 per cent call them good; 66 per cent fair; 11 per cent poor. Production has increased in 38 per cent of the reports, decreased in 62 per cent; sales quantities have increased in 34 per cent, decreased in 66 per cent; stocks are low in 22 per cent, normal in 72 per cent, over in 6 per cent. Sixty per cent of the companies have increased employment, 40 per cent decreased; all report increased wages; no labor shortage; no labor troubles.

Machinery

Improvement is seen. Of the companies reporting 38 per cent class present business as excellent; 39 per cent as good; 20 per cent as fair; 3 per cent poor. Last year the group reported 25 per cent excellent; 28 per cent good; 36 per cent fair and 19 per cent poor. Prospects for the winter are considered excellent by 20 per cent; good by 63 per cent; fair by 17 per cent; poor by none. Production is reported increased by 89 per cent of the companies, decreased by 11

per cent; sales quantities have increased in 86 per cent of the companies; decreased in 14 per cent; sales values have increased in 81 per cent, decreased in 19 per cent; stocks on hand are low in 18 per cent, normal in 76 per cent, over in 6 per cent. Increased employment is reported by 83 per cent of the companies, decreased by 17 per cent; increased wages are reported by 94 per cent, decreased wages by 6 per cent; 30 per cent report shortage of skilled labor; 4 per cent report shortage of unskilled labor; no labor troubles.

Metals

Sixteen per cent of the reports class present business excellent; 56 per cent good; 20 per cent fair; 8 per cent poor. Here is a slight gain over the excellent-good classes of last year when the group reported 28 per cent excellent; 38 per cent good; 30 per cent fair; 4 per cent poor. Of these companies, 16 per cent report prospects for the winter as excellent; 56 per cent good; 20 per cent fair; 8 per cent poor. Production over last year shows an increase in 70 per cent of the reports, decrease in 30 per cent; sales quantities have increased in 68 per cent, decreased in 32 per cent; sales values have increased in 58 per cent; decreased in 42 per cent; stocks on hand are low in 16 per cent; normal in 80 per cent and over in 4 per cent. Sixty-eight per cent of the companies report increased employment, 32 per cent decreases; 92 per cent report increased wages, 8 per cent decreases; 14 per cent report skilled labor shortage; four per cent report strikes.

Paints, Oils and Varnishes

Shows decline. Seven per cent of the companies class business as excellent; 62 per cent good; 31 per cent fair. Last year the same group reported 17 per cent finding business excellent; 58 per cent good; 25 per cent fair. Prospects for the winter are regarded as excellent by 7 per cent; good by 51 per cent; fair by 42 per cent. Production has been increased by 88 per cent of the companies, decreased by 12 per cent; sales quantities have increased in 72 per cent of the companies, decreased in 28 per cent; sales values have increased over last fall in 86 per cent of the reports, decreased in 14 per cent; stocks on hand are reported normal by all this group. Fifty-eight per cent of these companies have increased employment, 42 per cent decreased; 67 per cent of them have increased wages, 33 per cent decreased; no labor shortage is reported; no labor troubles.

Paper and Pulp

Show improvement. Ten per cent of the companies report business as excellent; 50 per cent good; 35 per cent fair; 5 per cent poor. Last year they reported 6 per cent excellent; 57 per cent good; 34 per cent fair; 3 per cent poor.

Directory of the Architectural and Building Trades of Philadelphia

WILL SOON GO TO PRESS

To be sure you are correctly listed with Address, Bell and Keystone Phone numbers, advise us of any change contemplated.

This Directory will be in the hands of the Architectural and Building Trades early in 1930.

If you have any product, material or services you sell to the Architectural and Building Trades of Philadelphia, an advertisement in this invaluable daily reference book will keep you constantly before prospective purchasers of your services and products.

PHILADELPHIA, PA.

Race 6746-6747-6748

Rittenhouse 9771-2

Prospects for the winter are regarded as excellent by 10 per cent; good by 50 per cent; fair by 40 per cent. Production has increased in 80 per cent of the reports, decreased in 20 per cent; sales quantities have increased in 53 per cent; decreased in 47 per cent; sales values have increased in 31 per cent, decreased in 69 per cent; stocks on hand are low in 5 per cent; normal in 85 per cent and over in 10 per cent. Increased employment is reported in 75 per cent of the companies, decreased in 25 per cent; wages have had increases in 84 per cent, decreases in 16 per cent; 3 per cent report skilled labor shortage; no labor troubles.

Rubber

Shows a falling off. Present conditions are reported excellent by 14 per cent; good by 29 per cent; fair by 43 per cent; poor by 14 per cent. This is a much worse showing than last year, as those reporting then classed business at that time, 43 per cent as excellent; 20 per cent good; 10 per cent fair and 4 per cent poor. None of the companies class the prospects for the winter as excellent; 57 per cent class them as good; 43 per cent fair; none as poor. Production compared with last fall is reported increased by 43 per cent, decreased by 57 per cent; sales quantities are reported increased by 60 per cent, decreased by 40 per cent; every company reports sales values as decreased; stocks on hand are low in 29 per cent of the reports, normal in 57 per cent, over in 14 per cent. Employment as compared with last fall has increased in 61 per cent of the companies and decreased in 29 per cent; 50 per cent of the companies report wage increases and a like percentage reports decreases; no labor shortage; no labor troubles.

Stationery and Printing

Improvement is shown. Thirteen per cent of the companies report present trade excellent; 52 per cent good; 26 per cent fair; 9 per cent poor. Last year the same group reported 3 per cent excellent; 71 per cent good; 26 per cent fair. Prospects for the winter are considered excellent by 13 per cent; good by 57 per cent; fair by 30 per cent. Production has been increased by 79 per cent; decreased by 21 per cent; sales quantities have increased in 75 per cent of the reports, decreased in 38 per cent; sales values have increased in 62 per cent, decreased in 38 per cent; stocks on hand are low in 18 per cent, normal in 82 per cent. Eighty per cent of the companies report increased employment, 20 per cent decreased; wages have been increased in 93 per cent of the companies, decreased in 7 per cent; 10 per cent report skilled labor shortage; no labor troubles.

Textiles

Present trade is reported excellent by

8 per cent; good by 43 per cent; fair by 36 per cent and poor by 13 per cent. Last year the group reported 19 per cent excellent; 30 per cent good; 39 per cent fair; 12 per cent poor. As to prospects for the winter, 1 per cent report excellent; 51 per cent good; 37 per cent fair and 11 per cent poor. Increased production is noted by 69 per cent, decreased by 31 per cent; increased sales quantities are noted by 67 per cent, decreased by 33 per cent; increased sales values are reported by 60 per cent, decreased by 40 per cent; stocks are reported low by 25 per cent, normal by 59 per cent and over by 16 per cent. Increased employment is reported by 65 per cent, decreased by 35 per cent; increased wages by 43 per cent, decreased by 57 per cent; 7 per cent report shortage of skilled labor; no labor troubles.

Miscellaneous

Shows slight improvement. Present conditions are reported excellent by 18 per cent; good by 51 per cent; fair by 26 per cent; poor by 5 per cent. Last year the group reported, 17 per cent excellent; 45 per cent good; 36 per cent fair; 2 per cent poor. As to prospects for the winter, 10 per cent report excellent; 5 per cent good; 26 per cent fair; 5 per cent poor. This large group reported last year on this phase, 10 per cent excellent; 51 per cent good; 38 per cent fair; 1 per cent poor. Increased production is reported by 72 per cent, decreased by 28 per cent; increased sales quantities by 75 per cent, decreased by 25 per cent; increased sales values by 65 per cent, decreased by 35 per cent; stocks on hand are low in 14 per cent of the reports, normal in 77 per cent, over in 9 per cent. Increased employment is reported by 71 per cent, decreased by 29 per cent; increased wages are reported by 91 per cent, 6 per cent of whom report large increases and decreases are reported by 9 per cent; 11 per cent report skilled labor shortage; no labor troubles.

A SURVEY OF THE BUILDING FIELD

The Engineering Economics Foundation has just completed a survey of the hotel business and has issued a report that contains some startling information, much of which has a considerable bearing on construction. The survey was started to determine the present status of the hotel business with respect to overbuilding, and developed some specific information and recommendations which, if followed, would result in making that industry more profitable than at present.

Some of the items discovered by the surveyors are:

Between 1920 and 1928 there was a 44 per cent increase in available hotel rooms, making a total of over 1,500,000 rooms

available with only 1,200,000 guests to fill them;

The trend of percentage of occupancy has been steadily declining, the percentage in 1920 being 85.5 and in 1928 it was 67.6. That it requires a 74 per cent occupancy to pay interest on a mortgage and bring a six per cent return on capital invested;

That although there has been a slowing down in the number of new hotels constructed since 1925 the number of rooms per hotel has been steadily increasing;

That there has been no material change in room rates since 1921;

That the number of hotel failures between 1925 and 1928 increased from 82 per year to 112 per year.

The recommendations as summed up by Hollis Godfrey, president of the Engineering-Economics Foundation, contain some pertinent advice that is well worthy of consideration in any branch of the building industry. The recommendations are:

First—That City Hotel Associations whose members are threatened with the over-construction menace conduct a survey similar to the one carried out by the Hotel Association of New York City.

Second—That before any new hotel is financed a detailed and unbiased survey be made by qualified and experienced hotel experts and accountants and that prospective investors be urged to request all such information as this and to consult with their bankers regarding the investment.

Third—That the hotel and allied interests insist upon a stricter enforcement than is at present exercised over the laws regarding the issuance and sale of real estate bonds, to the end that inflated appraisals and speculative securities will be eliminated from hotel financing.

These recommendations are certainly applicable to all building construction and the idea might easily be extended to apartments and office buildings. It would save many a project from failure if the proponents had a source of information that would give them the renting possibilities based on the business obtainable and the need for the contemplated project.

It is not likely nor is it expected that a survey of this sort extended to other branches of the industry will prevent the erection of structures in overcrowded fields any more than will the present survey eliminate the construction of new hotel projects whether needed or not. It is possible that the construction of new projects having newer appurtenances and some new idea of service will make last year's buildings obsolescent. It will, however, provide the investor with a greater security if a better knowledge of the earning power of the project is at hand, thereby bringing a return of finance to this field.—*American Contractor*.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

This Stucco House Is Always Dry—

HENRY DOLLEMAN RESIDENCE INDIANAPOLIS, IND.
LEROY SMITH, STUCCO CONTRACTOR

It's Waterproofed with "ANTI-HYDRO"

The interior of this stucco house is always dry because it is permanently waterproofed with "ANTI-HYDRO." The exterior will never chip, craze or map-crack because "ANTI-HYDRO" has also hardened it. And the rich buff colored stucco will not fade or stain because the use of "ANTI-HYDRO" insures uniform color.

By hardening and waterproofing stucco with "ANTI-HYDRO" you preserve the beauty of your jobs indefinitely and eliminate patching and repairs after the building is completed.

"ANTI-HYDRO" is easy and economical to use. It is a liquid which mixes readily with the water used to wet down stucco. It enriches stucco and makes it stick firmly to walls and prevents sliding. Workmen can plaster 50 per cent more surface in the same time as they can using plain cement mortar. "ANTI-HYDRO" makes stucco bond secure to tile, brick and concrete. When applied on metal lath it protects the lath against rusting. Used with any dry mortar color or white cement and sand without dimming or changing the color.

"ANTI-HYDRO" results are guaranteed satisfactory and backed by a 25-year reputation for permanence. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

FINDS RAPID SWING TO FIVE-DAY WEEK

The five-day or forty-hour week, for building trades mechanics is probably the most important issue now facing the nation's building industry. To obtain the extensiveness of the five-day week movement, S. W. Strauss & Co., has made a national survey of industrial conditions in this industry. The result of this survey shows that the trend is rapidly swinging to the shorter week and that at this time approximately twenty-five per cent. of the building mechanics of the country are working on the basis of the forty-hour week.

Data and statistics on the short work week were obtained from builders in 100 large cities that range from Coast to Coast, from cities along the Canadian border southward to the Gulf of Mexico. Builders in a large percentage of the cities responded with the desired information. This information furnished shows there are approximately 200,000 building trades artisans employed on the five-day week basis.

Officials of the building trades depart-

ment of the American Federation of Labor estimate the membership of the organized building trades workers in the United States and Canada at 800,000.

The backbone of the five-day week movement is furnished by the building workers of the metropolitan district of New York. It is estimated that of the 200,000 building workers now on the five-day schedule, 150,000 of them are New York craftsmen, 18,000 of the five-day week workers are Pittsburgh mechanics and the remaining 32,000 are journeymen that have procured the forty-hour week in individual trades units in other cities.

Considerable impetus will be given the five-day movement if Chicago's 110,000 building workers succeed in procuring it. Most Chicago building trades received wage increases late this spring and early summer. There was talk of the forty-hour week when contracts were being negotiated but this agitation was shelved when the trades were given a substantial wage increase. Recently, however, agitation for the five-day week started in Chicago. This movement began shortly after the short work week was conceded to the New York building workers. Chicago builders are giving the forty-hour week consideration and a decision is expected soon.

In obtaining data on the five-day week, effort was extended to secure for the survey a general idea of labor conditions in the building industry in the United States and Canada. There are practically no strikes of building mechanics. Occasional jurisdictional disputes that develop between individual trades and building contractors are quickly and amicably settled.

Wage rates for building workers throughout the United States are the highest in history; New York taking the lead with the \$1.87½ rate paid bricklayers. The wage for this craft will be increased on the first of the year by a few cents and the contract will then remain in force until 1932.

Plasterers in New York are receiving \$1.75 an hour, while in Chicago both bricklayers and plasterers have negotiated an agreement for \$1.70 an hour. The Chicago plasterers are engaged on a five-day week basis. Iron workers in New York receive \$1.75 an hour; in Chicago \$1.62½ an hour. There are a number of New York trades, however, receiving \$1.50 an hour; a greater percentage of them, in fact, than in Chicago where the average wage rate is \$1.62½ an hour.

Building contractors and various associations of builders throughout the United States and Canada, in their reports on the forty-hour week, point out that the bricklayers, plasterers, painters and lathers are the four trades that are the pioneers in the five-day work week for building trades workers. In some cities reports from builders show that there are now five and six trades employed on the

forty-hour schedule, while reports from others show that only one and two and three trades are now employed on the short work week basis.

The forty-hour movement has become pronounced in Boston, New York, Chicago, St. Louis, Pittsburgh, Spokane, Springfield (Mass.), Cleveland, Philadelphia, Providence, Hammond (Ind.), Indianapolis, Harrisburg, Denver, Dayton, Elizabeth, Cincinnati, Dallas, Atlantic City, Louisville, Birmingham, Toronto, Utica, Wilmington, Bridgeport, Buffalo, Butte, Evansville, Gary, Rock Island, Pasadena, Lynn, Seattle and Scranton. It is estimated that in all more than 300 cities and towns in the United States now have the five-day week in at least one trade.

The Strauss survey reveals an important change which is happening in the building industry through the high wage scale structure and the adoption of the forty-hour week. This change, builders say, will confront, within a short time, the organized building trades with a most perplexing problem.

These builders point out that in order to cope on a warranted basis with the present high wage structure, contractors are demanding a maximum of efficiency from all building workers. This requirement automatically has begun to hold the confines of construction to mechanics who are not too old. This condition has brought about an elimination process through the rapid return to normalcy of construction activities throughout the country. Today in practically all the large cities, with the possible exception of New York, there is a large surplus of building mechanics unable to find employment.—*Associated Contractor.*

The reformation of those methods and conditions that have made for irresponsibility in the construction industry is proceeding so rapidly as to promise early results throughout the nation, declared D. A. Garber, general manager of the Associated General Contractors of America, shortly after the close of the conference of the executive bodies of that organization held at Hartford, Connecticut, October 7 to 9.

The hundreds of millions of dollars lost in bad accounts, the unwarranted delays in construction, the dual payments forced from owners under existing lien laws and the countless other losses sustained by the public because of existing uneconomic practices were all under review at the executive board meeting, where plans were perfected for promoting the present housecleaning program of the association.

The task of substituting sound business practices for the prevailing haphazard procedure involves five major objectives, it is stated by Mr. Garber. Each of these will tend to correct conditions which have

made for irresponsibility and will become effective at succeeding stages of initiating and carrying forward construction contracts.

Mr. Garber states that the five objectives toward which the various groups in the industry are co-operating include: prequalification of contractors before being allowed to bid, instituting more rigid examination of contractor applicants for surety bonds, the elimination of loose credit in the sale of construction equipment, greater care in extending banking credit to contractors and the curbing of loose credit in selling construction materials to contractors.

The significance of these reforms in construction business procedure are said to be as follows:

The system which has long prevailed of awarding work without due regard to the qualifications of the lowest bidder is rapidly being revised through a procedure which provides that public officials shall require contractors to submit evidence of their qualifications before being allowed to bid on proposed work.

Since one measure of a contractor's responsibility has been determined by his ability to secure a performance bond written by a surety company, the second stage of the housecleaning program has been directed toward a reform of certain practices involved in writing surety bonds.

Co-operation between organized contractors and surety companies has resulted in the launching of the Bureau of Contract Information, Incorporated, which is gathering the performance records of every contractor in the United States so that factual information may be available to all surety companies when any contractor seeks to secure a bond guaranteeing his own performance.

Through the double scrutiny which a

contractor's qualifications will receive in passing the prequalification tests given by awarding officials and in passing the past performance examinations given by surety companies, it is thought that rampant irresponsibility will be brought under partial control, at least.

The third item on the program being fostered by the contractors' association involves co-operation with bankers to the end that banks may more intelligently scrutinize the qualifications of those contractors who apply to them for credit. The procedure advocated involves the use of a standard form of questionnaire devised for bankers, which when filled out is claimed to provide a more accurate picture of a contractor's business condition than the commercial forms ordinarily used satisfactorily by banks in gathering information from mercantile and other such business concerns.

The fourth point of the housecleaning program involves the development of co-operation between organized contractors and the manufacturers of construction equipment to the end that standard credit terms may be applied in selling equipment. By the adoption of such terms it is expected that when a contractor satisfactorily passes the tests of prequalification so as to be allowed to bid, satisfies his surety as to his past performance record and satisfies his banker as to his financial ability he will still have to buy his equipment on businesslike terms rather than expect the equipment companies to grant him credit for indefinite periods.

The fifth housecleaning procedure involves co-operation with producers and dealers of construction materials to the end that loose credit practices will be eliminated in selling building materials to the industry. This program has already resulted in the promotion of allied construction industry credit bureaus in some

fifty cities. In Detroit, Memphis and Los Angeles, where the interchange of credit information is furthest advanced, these efforts have not only revealed cumulative credit losses that have totaled well over \$30,000,000 but have already been effective in cutting down delinquencies and weeding out the irresponsible accounts.

ALIVE IN THE DEAD OF WINTER

Silent fields and frozen streams . . . hibernating bears . . . nature dormant.

No wonder ancient man huddled close about the fire in his hut; for the weather ruled his life.

But modern man lives a different life. He has built a complex civilization, with industry at its heart and business as its vital energy. And modern man, faced by an emergency, goes to work harder than ever and tells the world—"Business as usual."

He does so not merely because he's energetic, but because he cannot afford to have the complicated machinery of his world slowed down. It's bad business—bad business for Labor, for Capital, for Government and for human beings of every class and group.

Time was when the building industry quit cold when the first snow flew. Laborers lost their jobs, expensive equipment depreciated in idleness, overhead costs piled up, the buying capacity of millions was cut down—and every aspect of business, from the corner grocery to the opera, suffered. Needed improvements remained undone, costly land produced only bills for taxes due; in short, the construction world stood still, waiting for Spring. And when Spring came, there was a mighty rush for labor, ma-

terials, engineers and all the rest—a spectacle impressively unintelligent!

Nowadays, winter is recognized as an asset, not a liability. Modern equipment scorns the "difficulties" of winter construction; modern workers are efficient in winter and their jobs reflect that efficiency. The precautions that must be taken are simple and financially negligible, for they are more than overbalanced by the profits involved.

Capital gains, labor gains, communities profit and the whole organization of the modern world is toned up.

The sane common sense of business has ironed out the folly of the winter slump.

Contemplating building? A factory? A warehouse? An apartment available for early spring renting? A civic improvement? An office building? Ask your architect or engineer or contractor. He knows that winter is not dead!

CONCERTED MOVE STARTED TO WEED OUT "THE IRRESPONSIBLES"

As a decisive move in a program launched to safeguard the public from the acts of irresponsible contractors, the Bureau of Contract Information has just been incorporated under the laws of Delaware.

Data on the manner in which each general contractor in the United States has fulfilled past contract obligations is to be gathered and utilized in an effort to eliminate conditions that have made for irresponsibility in the construction industry. This was just announced by the Associated General Contractors of America and comes as the culmination of several

years of debate about practices involved in the writing of surety bonds.

The undertaking is a venture in co-operation between surety companies and organized contractors although it is independently organized as a fact gathering and investigating agency.

Through this bureau the actual work of gathering and compiling the business histories of some 26,000 firms listed as construction companies is being started under the direction of S. M. Williams, who is the manager of the Engineering Construction Division of the Contractors' Association. With the active backing of the organized contractors Williams represents, it is anticipated that this effort to make available the facts regarding the responsibility of every contractor will be carried to a successful conclusion.

Individual surety companies interested in the bureau have likewise agreed to pool their records. Questionnaires are rapidly being forwarded to contractors in order to obtain data direct from them as to their past performance and qualifications.

Costly delays that ensue when a contractor defaults on his contract, forcing his surety to take over and complete the work, have long been recognized as a source of loss and annoyance to the public which is deprived of the use of the improvement and suffers from the inconveniences attendant while construction operations are unduly extended.

The losses to surety companies, material and supply interests and the construction industry generally are conceived to be equally great. By having a record of the past performance of contractors available through an unbiased fact finding agency it is conceived that surety companies will be able to more intelligently judge of the ability of a contractor to carry through the contract on which they are called upon to write bonds guaranteeing performance.

In arguments during past years, charges of carelessness made against surety companies by contractors have been countered by citations indicating that contractors have failed to give accurate information about their businesses. The extensive and sometimes acrimonious debate on these points appears to have prepared the way for active co-operation and both groups are pinning their hopes on the success of the Bureau of Contract Information, Incorporated.—*Associated Contractor.*

NEW TYPES of buildings create new conditions for everyone who designs or constructs them. The new conditions require both a technical and an economic readjustment. Generally speaking, the technical readjustment in designing is made quickly. Nowhere in the world are engineers of all kinds and architects more versatile in developing a new technique. Never having failed, we naturally expect

Directory of the Architectural and Building Trades of Philadelphia

WILL SOON GO TO PRESS

To be sure you are correctly listed with Address, Bell and Keystone Phone numbers, advise us of any change contemplated.

This Directory will be in the hands of the Architectural and Building Trades early in 1930.

If you have any product, material or services you sell to the Architectural and Building Trades of Philadelphia, an advertisement in this invaluable daily reference book will keep you constantly before prospective purchasers of your services and products.

it of them and are too apt to accept their new production merely as "a matter of course."

"WITH THANKS" is not enough compensation for the demand of the new type buildings. One change in a building affects every item of its construction and it probably affects the structural engineering more than any other part. How?

IN THE "good old days" when the status of and compensation for structural engineering work was first established, buildings were simple affairs and not large. Now they are changed in almost every particular and each change has placed a greater burden of work upon the engineer with a corresponding necessity for greater knowledge and increased responsibility.

INCREASED HEIGHT of buildings is an important item of the new type. It necessitated the development of a system of wind bracing to resist wind and secondary stresses. A theory had to be established and a technique devised and as buildings increased to greater heights the responsibility for safe construction increased proportionately. The limit of height is by no means reached—scarcely anticipated. As the new demands come, the structural engineer is ready and the confidence placed in him has not been misplaced.

FLOOR LOAD requirements are also much more complicated. Loads are much heavier. Machinery is heavier, does more work and produces complicated impact stresses. Special transporting and elevating machinery require special provisions for its installation and support. All industrial building design is becoming more special as special processes and products are invented.

MECHANICAL EQUIPMENT from elevators to heating and plumbing is more complicated and with it structural parts must be coordinated in the design. Absolutely nothing can be left to chance. The engineer must foresee all of the necessities required and make provision therefor.

DARING INNOVATIONS, as they appear compared to the old time simplicity, are demanded as a matter of course. Large rooms requiring the elimination of columns are made at the top, middle or bottom of the building as the occupancy demands. Tremendous loads are shunted to one side, transferred to new bearings and back again with the same nonchalance and dexterity that distinguishes the marvelous prestidigitator. It's nothing, the engineer simply does it.

ECONOMICAL DESIGNING of the structural parts of buildings is demanded to offset the greatly increased cost of construction. Reducing or preventing rising labor costs or the price of materials appears to be simply out of the question. So the engineer has to reduce

the cost of the structural frame. They know that he never falls down on the job.

HE SIMPLY has to cut the cost in the face of tremendously increased requirements of greater and still greater buildings. It is an anomalous situation. By his skill, ingenuity and imagination in devising new combinations of sections, new connection details, simplify the distribution of loads and a thousand and one other things, he makes each pound of steel perform its maximum service.

WHAT IS the story? It is much more difficult, requires more time and knowledge, increases the responsibility and the cost to produce structural engineering designs for the new types of buildings.

"WITH THANKS" does not balance the account by any means. Every profession, every industry and business must operate with a profit if adequate service is to be rendered.

AGAIN:

Correct relations are the basis of social and economic welfare.

On the structural frame hang all of the building and its contents.

A SUGGESTION WITH REFERENCE TO BUILDING CODE REVISION

Eventually some agency of unquestioned integrity and equally recognized ability must assume the authority to supervise the writing of the building codes of the cities of America.

Until this is done there will always be laxity in their provisions which should make for safety.

Until this is done there will always be discrimination shown as between materials.

Until this is done building codes will not accomplish what they are intended to do. They will not insure the use of the best materials to the best advantage. They will not provide the safeguards to life and health which they are expected to make mandatory.

Until this is done they will permit gross abuses of the best principles of building construction. They will continue to grant extreme privileges to those materials whose proponents happen to be politically powerful or more adroit than their competitors in manipulating legislation.

Building codes have always permitted this in the past.

They are doing it today.

And they will continue so to do until the framing of them is placed in some very definite and undisputed hands which are unfettered by material affiliation or political influence.

The big question is: Whose hands shall they be?

And just as certain as the sun will rise tomorrow morning and set again tomorrow night, this suggestion will be resented

by the councilmen of every city in the country. For city councilmen are inordinately jealous of their authority, etc.

They're intended primarily to insure safety and sanitation in building construction. This affects the whole people and, incidentally, investment. The problem should be handled in a broad way.

Probably the American Standards Association stands pre-eminent among the organizations having to do with construction. It is composed of delegates from all other organizations prominent in construction.

Its tasks and its accomplishments are altogether altruistic. It isn't paid for what it may do.

Possibly it might be persuaded to recommend for each state the personnel of a building code revision, this board to be authorized by legislative enactment and to be named by the governor upon the Association's recommendation. And of course to be paid by the state.

Such a board, free from political obligation, from material influence, made up of men at the head of their individual professions, might, if any body of men might ever, be trusted to act impartially as a clearing house for all building codes of the cities of any given state. Its decisions should be final.

This may all appear idealistic, impractical, even fantastic, but something of the sort must be evolved if the grip of private, selfish interest is to be broken and the building code is to become the weapon of safety it was originally intended to be.—*Building Economy*.

HOW TO MAKE WET CELLARS DRY SUBJECT OF NEW U. S. BULLETIN

Wetness of basements and cellars is experienced by many home owners, but comparatively few know what to do about it. The U. S. Department of Agriculture has just issued a bulletin on the subject, Farmers' Bulletin No. 1572-F, "Making Cellars Dry." In some cases wet cellars can be made dry by gravity drainage of the site and in other cases better ventilation will improve conditions. Water-tight construction and water-proofing are good preventives of wetness. The bulletin makes suggestions regarding the prevention of wetness and dampness. It tells how to avoid the trouble when building a house and how to remedy it in old cellars. Lighting and ventilation, important factors, are discussed. Dryness in the cellar promotes comfort and health in the home, lengthens the life of houses, furnishings, and plumbing, and increases the usefulness of basements for storage, workshop, and laundry purposes. While the supply lasts, the bulletin may be obtained free from the Office of Information, Department of Agriculture, Washington, D. C., upon request.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

This Stucco House Is Always Dry—

HENRY DOLLEMAN RESIDENCE INDIANAPOLIS, IND.
LEROY SMITH, STUCCO CONTRACTOR

It's Waterproofed with "ANTI-HYDRO"

The interior of this stucco house is always dry because it is permanently waterproofed with "ANTI-HYDRO." The exterior will never chip, craze or map-crack because "ANTI-HYDRO" has also hardened it. And the rich buff colored stucco will not fade or stain because the use of "ANTI-HYDRO" insures uniform color.

By hardening and waterproofing stucco with "ANTI-HYDRO" you preserve the beauty of your jobs indefinitely and eliminate patching and repairs after the building is completed.

"ANTI-HYDRO" is easy and economical to use. It is a liquid which mixes readily with the water used to wet down stucco. It enriches stucco and makes it stick firmly to walls and prevents sliding. Workmen can plaster 50 per cent more surface in the same time as they can using plain cement mortar. "ANTI-HYDRO" makes stucco bond secure to tile, brick and concrete. When applied on metal lath it protects the lath against rusting. Used with any dry mortar color or white cement and sand without dimming or changing the color.

"ANTI-HYDRO" results are guaranteed satisfactory and backed by a 25-year reputation for permanence. Use it on your next job.

Associate architect and supervisor, Alvin C. Bieber, 1520 Locust Street, Philadelphia, Pa. Owners, St. Philip's Lutheran Church for Board of Colored Lutheran Missions, care of architects.

The man with an order to place doesn't hunt you up in the city directory these days. He hasn't the time. If he can't find you in your trade magazine he can and does find somebody else, and that somebody else books the order.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

OCTOBER CONSTRUCTION IN PHILADELPHIA HIGHEST SINCE 1926

1,062 *Developments Started to Cost*
\$8,175,510, *Up* \$2,437,051 *Over*
Last Year

More construction was started in October than in any corresponding month since 1926, according to the official report of the Philadelphia Bureau of Building Inspection issued by Morris Brooks, chief of the bureau. It showed that 1,062 developments were started, at an estimated cost of \$8,175,510, which is an increase of \$2,437,051, as compared with October of last year.

Schools and office buildings contributed largely to the monthly total, although dwelling operations and industrial buildings also helped considerably. There were 221 houses started, at an estimated cost of \$952,000.

Last month's activity aided considerably in reducing this year's decrease. For the ten months of this year the report shows that permits were issued for construction costing \$92,374,935, as compared with \$100,057,635 for the same period of 1928.

A statement of the character of buildings with the number of permits, operations and estimated cost, follows:

	Permits	Oper.	Est. Cost
Dwellings—			
One-story	1	1	\$2,000
Two-story	31	211	895,500
Three-story	6	9	44,500
Manufactories	7	7	497,400
Workshops	1	7	258,300
Garages	103	108	263,850
Office Buildings	4	4	1,677,300
Stores	5	5	111,000
Warehouses	6	6	240,200
Schools	4	4	2,890,420
Clubhouses	1	1	50,000
Bank Buildings	2	2	68,000
Parish Buildings	1	1	70,000
Railroad Stations ...	1	1	130,000

Totals.....	856	1062	\$8,175,510

Annual Exhibition of Philadelphia Chapter of the American Institute of Architects and the T Square Club opened in John Wanamaker Store, Philadelphia, Friday evening, October 31.

A formal dinner, memorial to Milton Bennett Medary, was held in the Cornation Room, presided over by Howell Lewis Shay, vice chairman of the Joint Exhibition Board, in the absence of Nicola D'Ascenzo, chairman, who was out of the city.

Three hundred architects, engineers, builders and others interested in the development of Philadelphia from an architectural viewpoint, attended the dinner and exhibition of this, the thirty-second annual exhibition.

Walter H. Thomas, president of the Philadelphia Chapter of the American Institute of Architects, extended a welcome to those assembled and paid a very high tribute to Milton B. Medary as a man and as an architect and spoke of the lasting qualities of his work and the endearing memory in which Mr. Medary will ever live in the hearts of Philadelphia architects.

Mr. George Howe, president of the T Square Club in his delightful, dignified style, expressed similar feeling toward Mr. Medary and extended a generous invitation to all to visit the exhibition and exhorted all present to encourage the public to visit the exhibition so as to have a greater appreciation of architecture.

Mr. E. Herrick Hammond, president of the American Institute of Architects, spoke of the wonderful qualities of Mr. Medary and cited some personal experiences of various work with which he and Mr. Medary were associated. Mr. Hammond referred to the high principles exemplified by Mr. Medary in the office of president of the American Institute of Architects and emphasized the noble spirit with which Mr. Medary performed his duties, and the great example left for subsequent officers.

James Monroe Hewlett delivered the principle address of the evening on the "Life and Works of Milton B. Medary." His remarks were most impressive and intensified the feeling of love and admiration with which all who knew Mr. Medary hold him.

A memorial exhibit of Mr. Medary's architectural achievements contains a number of views of the Mountain Lake Carillon, Mountain Lake, Fla., as well as buildings in the Chicago and Princeton Universities.

Virtually every type of construction is on display, from charming types of Colonial architecture to the more pronounced modernistic trend, of which there are some fine examples. About eighty architects of this city, New York, Chicago and Los Angeles have contributed to the exhibit.

A number of designers in the allied arts, such as woodcarving, stained glass, modeling and wrought iron, also have their work on exhibition.

Besides the memorial group to Mr. Medary, there are exhibits of Edgar Seeler, Philadelphia architect, who died recently, and a sculpture by Charles Grafly, noted Philadelphia sculptor, who died some months ago.

A medal, the annual award of the Phila-

delphia Chapter, American Institute of Architects, was awarded to Karcher & Smith, of this city, for their designs of dormitory buildings in the Swarthmore College group. E. Herrick Hammond, president of the American Institute of Architects; Walter H. Thomas, president of the Philadelphia Chapter, and John Harbeson, architects, formed a committee in choosing the award.

The Joint Exhibition Board in charge of this year's display is composed of Nichola D'Ascenzo, chairman; Howell Lewis Shay, vice chairman; George Wharton Pepper, Jr., secretary; D. Knickerbocker Boyd, managing director; James Bush-Brown, Harry Sternfeld, Herbert R. Leicht and Isabel M. McCoy, executive secretary of the Philadelphia Chapter, A. I. A.

The Joint Exhibition Board is to be congratulated on the 1929 year book issued in connection with annual exhibition and dedicated this year to the Memory of Milton Bennett Medary, whose charming photograph graces the page following the title page. The year book contains a rare collection of exquisite interiors, beautiful sketches of prospects, and gorgeous exteriors of completed work of many famous architects.

The year book should be in the library of every architect, draftsman, engineer as well as in the home of every lover of beautiful things. The price, \$2.50, is trivial when the contents are considered.

MEETING THE ARCHITECT HALF WAY

*Advantages of Architect-Builder Corporation Told in Interview with
L. V. Boyd*

By L. K. DAVIS

"Cannot builders and architects share each other's problems in a manner that will benefit both?" I asked Architect Lawrence Visscher Boyd as my first question when seated in his office.

"If not, why not,—and what's to be done about it?"

Without giving him a chance to reply, I went on to present the other questions I had made up as a result of my talks with builders. They were:

"Does the architect 'high hat' the man who works from the plans and specifications?"

"Is the average builder too much tempted 'to go on his own' in matters of design?"

"Is the average architect often impractical to a degree that causes unnecessary structural complications?"

"Is architectural superintendence often an irritation instead of an aid?"

"And lastly, is the architect's service

free, particularly on small work, sometimes an excess cost which owners should not be asked to add to their other costs?"

He hesitated a moment as a result of this avalanche of questions, then replied:

"The first two questions cover most of your points," he said with a smile. "I'm glad you've asked them. Let me tell you why I believe there should be the closest sort of relations between architects and builders.

"An owner employs an architect with several definite things in view. He wants a building that, first of all, is right in its design. He wants its plan to meet special requirements. That settled, he wants the final cost to be reasonably close to a price he has decided he shall pay.

Co-operation is Essential

"If the architect is experienced in designing and following construction progress of the type of work for which he has been selected, the first important step has been made toward co-operation of the kind we're discussing. Architecture has become a highly specialized profession. There's architecture of distinctly city type, industrial architecture, institutional architecture, country and suburban architecture. Each is a subject in itself and has closely grouped problems of design and construction. When owners appreciate this fact more fully, perfect co-ordination between the architect and

builder ought to follow as a matter of course.

"The architect who gets into a field filled with structural problems that are entirely different from those in which he is well versed is apt to have difficulty in working closely as he should with the man who follows his plans and specifications. I believe that most failures in architect and builder co-operation could be traced to this as their main cause.

"Among the dozens of builders with whom I have worked, I cannot remember one who was not glad to have an experienced architect associated with his efforts from start to finish of the job. When I say 'start and finish,' I mean exactly that; and by 'start' I mean the very start, the time at which an architect has his designs in more or less preliminary form, and not at the final stage when plans and specifications are ready for an iron-clad estimate.

"In my own case, I learned early the value of going over the problems of structural as well as owner requirements with the men who later would be asked for bids. Many a time this has been done before even the rough sketches were submitted to the owner. It is surprising how many variations may come about during such discussions, particularly as affecting costs. Invariably they serve to work out economies in material and labor, and settle many questions which otherwise would

become real difficulties with the work under way.

"The proper development of plans and specifications before actual estimates are required removes a lot of guesswork from a builder's calculations. It is almost sure to result in freedom from arbitrary demands, vague specification clauses and ambiguous statements which can cause so many troubles for everyone concerned.

"Once an architect and builder begin in this way, the most thorough kind of co-operation usually follows through each structural phase to final completion. Circumstances often arise in which the co-operative suggestions of the architect result in changes, sometimes on large scale, from which the owner receives more for his money than was originally contemplated. Many of these I have built into a permanent record, making them part of specifications used for the type of work on which they were first tried out.

How Architect Helped

"I have in mind one instance where an owner desired a beamed ceiling for his library after work had begun. The extra cost of planed and painted material for this unforeseen change raised immediate objection.

"Between us, the builder and I worked out the effect desired without increase of cost—rough but true hemlock joists of the second floor exposed, block-bridged, and colored tobacco brown by shingle stain!

"In another home of my design, a country home, the owner suddenly longed for wrought-iron latches and hinges on interior doors. That, too, raised a question of considerable extra cost.

"The builder and I talked it over. Then at a local hardware store we bought, for

15 cents apiece, a few enameled thumb-latches and hinges of the common stable door variety. These we tossed upon the red coals of a kitchen stove, turning them over every couple of minutes or so until the glistening black coating had burned away. The result was an almost unbelievably decorative effect in richly mottled iron. So the owner had what he wished, at a mere fraction of the price we had feared.

Made Saving for Builder

"Working closely with the builders, sharing their problems, has brought forth many structural efficiencies which without mutual co-operation would never have been realized, certainly not if superintendence had been made from a strictly architectural point of view.

"On such a simple interior accessory as baseboards, for example, builders and I have often repeated substantial reduction of material cost by using 5-inch instead of 10-inch boards. Those of one-half the usual specifications height serve their purpose perfectly and add besides a decided impression of greater-than-actual area in small rooms.

An Idea for Brick Laying

"New ways and means are constantly suggesting themselves to the architect who stays in close touch with the contractor. Years ago a builder and I discovered a way to lay the brickwork of hearths, porches, terraces and walks, which I have since always advised for work of this character. A base of rough concrete is first prepared. Over this is spread an even bone dry mix of equal parts portland cement and sand, one inch in depth. The bricks are placed and samped solidly. Then the entire surface is soaked to full

absorption from the fine sprinkler nozzle of a hose. The water of course, goes through the joint spaces, which should be kept open and free from cements and sand, to the dry mix. This forms a solid bond on the bottom and well up the sides of each brick, holding with a grip which defies disruption by time or weather. A further advantage in this method is the absence of surface staining.

"Another effective method which I have learned from builder associations is the easy and economical damp-proofing of exterior walls of brick or stone. Many a dollar has been spent by owners in trying to overcome the effects of moisture which, through capillarity, has climbed a wall from damp ground below the grade line. I have known many a splendid piece of stucco to require expensive repair or replacement because of repeated saturation by water that has risen ten and more feet above the foundations.

Finding Short Cuts

"In all work where there is even a remote risk of this occurring, I find contractors are only too glad to fall in with my suggestions that a course of roofing slate, edge butted to edge, be laid across the thickness of the exterior wall at a height of 6 inches above grade line. And I have yet to see the method fail.

"In many buildings where strict economy must govern the use of material, numbers of 'dodges' and 'short cuts' advised by the structurally minded architect may aid in gaining maximum effect at little cost. A striking example of this happened on one development for which I had been employed as supervising architect.

Improved Trusses

"For economy's sake, but with some misgivings, 3-inch floor joists had been specified instead of heavier material. These gave the floor centers of some of the larger rooms a most annoying 'spring.' The builder and I racked our brains for a remedy which would not pile up extras. Finally we hit on one that made these floors as rigid as concrete.

"7/8-inch x 3-inch strips were cut from waste lumber. Two of these were used to a joist, nailed diagonally across one side from opposite ends and meeting at a carefully mitered angle below the top of the joist exactly in the center of the span. These improvised trusses took up the thrust from the floor above and gave all the strength and stiffness of the heavier material, minus its added cost.

"The list of efficiencies made possible by thoroughgoing co-operation, you see, could be a long one. In it would be a great variety of worthwhile items, ranging possibly from extra chimney flues with paddle dampers for the elimination of kitchen heat and odors, to 'trapdooring' library floors beside fireplaces with al-

most invisible bevel-edged hatches matching access to firewood kept ready for use on a stage of scantlings at foot or so below floor level.

"Architecture, building, allied trades and crafts, are not independent elements as some of us have come to believe. They should function together through intimate man-to-man contacts which, as I have found in my own experiences, must begin at the beginning and remain close-meshed until the owner takes possession. When this becomes more general, architects and builders will realize how much one depends upon the other."

In addition to the helpful suggestions made by Architect Boyd, we may well consider for a moment ways and means now being practiced in many parts of the country to bring about better feeling between the architect and the builder.

One of the outstanding examples is the New York Building Congress where representatives of the entire building industry co-operate in bringing about reforms in which all are interested. Monthly luncheons are held in which a speaker, whether architect, builder or engineer, discusses some problem of mutual interest. The contacts established at these meetings do much to help the various elements in the building business to get an understanding of each other's point of view.

After all, it is very apparent that no architect worth his salt has any desire to make the contractor lose money; it is, rather, to his best interest to maintain a friendly feeling with the builder. On the other hand, no intelligent contractor or sub-contractor can ignore the valuable information and help which he may obtain through contact with an architect.

Getting the Men Together

One very helpful suggestion that has been offered is that local builders' exchanges and other contractor-builder or-

ganizations make an effort to get in touch with architects in their communities. It is suggested that letters be written to the secretary of the local chapter of the American Institute of Architects or to leading architects, inviting them to attend luncheons or evening meetings of the builders. In return, representatives of the contractors' organization would be invited to attend meetings of the architects and the viewpoints of both groups be exchanged.—*Building Age*.

A great deal of objection to retail encroachment into residence districts is being overcome by merchants who are having their buildings designed to fit into the architectural scheme of the particular districts in which they are located, said Paul J. Vollmar, vice-president and treasurer of the Western Securities Company, Omaha, Nebr., speaking before the Sixteenth Annual Convention of the Mortgage Bankers' Association of America.

Merchants have found this new type of store unit to be a most powerful advertising feature that creates good-will in the neighborhood and gives a marked individuality to their location, said Mr. Vollmar, whose subject was "The Mortgage Bankers' Service in Co-ordinating Building Design with Loan Values."

Mortgage men must look at properties from the point of view of what they will be in five, ten, or fifteen years, and endeavor to judge their future status in comparison with the newer units of far away periods, said the speaker. This must be done because the mortgage banker wants to renew his loans when they mature and so should prepare for the future now.

Shower baths have a good credit standing with the mortgage banker, said Mr. Vollmar, for both men and women like showers. Tenants will pay for conveni-

ences but care must be taken in financing income property to see that the cost and quality of the equipment and finish are in keeping with the class and type of the building.

"Climatic conditions control construction types in many places," said Mr. Vollmar. "It is surprising the number of people who see some particular type of property which they like in their travels and insist upon duplicating it when they return home, irrespective of different climatic and building conditions. We must appraise property according to the type of construction best suited to the territory in which the loan is situated, not only to have a saleable unit but to have a satisfactory home for the owner."

Beauty, strength, permanence, flexibility, movability and economy, are the basic characteristics of best practice in bridge construction. This is forceably illustrated in a publication just issued by the American Institute of Steel Construction, which presents in illustration for the first time an extensive collection of bridges throughout the world.

"Steel," states the preface, "possesses the quality of beauty-potentiality in an unparalleled degree because its physical properties permit it to be fabricated into any desired form that is suitable for bridges without impairing its strength."

Great highways do more than develop traffic, they act as means of disseminating culture. We improve the design of the wayside stand and station and in some instances have gone to the expense to landscape the roadway. It is therefore becoming essential that the bridges be made more artistic. This publication is issued for the sole purpose of offering suggestions tending to improve bridge architecture.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

This Stucco House Is Always Dry—

HENRY DOLLEMAN RESIDENCE
LEROY SMITH, STUCCO CONTRACTOR
INDIANAPOLIS, IND.

It's Waterproofed with "ANTI-HYDRO"

The interior of this stucco house is always dry because it is permanently waterproofed with "ANTI-HYDRO." The exterior will never chip, craze or map-crack because "ANTI-HYDRO" has also hardened it. And the rich buff colored stucco will not fade or stain because the use of "ANTI-HYDRO" insures uniform color.

By hardening and waterproofing stucco with "ANTI-HYDRO" you preserve the beauty of your jobs indefinitely and eliminate patching and repairs after the building is completed.

"ANTI-HYDRO" is easy and economical to use. It is a liquid which mixes readily with the water used to wet down stucco. It enriches stucco and makes it stick firmly to walls and prevents sliding. Workmen can plaster 50 per cent more surface in the same time as they can using plain cement mortar. "ANTI-HYDRO" makes stucco bond secure to tile, brick and concrete. When applied on metal lath it protects the lath against rusting. Used with any dry mortar color or white cement and sand without dimming or changing the color.

"ANTI-HYDRO" results are guaranteed satisfactory and backed by a 25-year reputation for permanence. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

Pennsylvania Contracts Awarded

Demolition of Mill Building and Storage, \$2,000, Swede St., along River front, Norristown, Pa. Contract awarded Wm. Hoehn, Norristown, Pa. Owners, Phila. Suburban County Gas & Electric Co., Bryn Mawr, Pa.

Service Station, Airy and Green Streets, Norristown, Pa. Contract awarded M. B. Barr, Norristown, Pa. Architect, private plans. Owners, Acme Service Stations, Inc., West Conshohocken, Pa. Brick and cement, 36x76 feet.

Residence, Ridley Park, Pa. Contract awarded Arthur E. Jones, Dupont and Chestnut Streets, Ridley Park, Pa. Architect, private plans. Owner, care of builder. Brick and frame, 2½ stories, shingle roof, electric light, hardwood floors. Work to start spring 1930.

Fire House, Lewistown, Pa. Contract awarded W. B. Steinbaugh & Son, Lewistown, Pa., who will build if project matures. Architects, Hodgins & Hill, 130 South Fifteenth street, Philadelphia. Owners, Brooklyn Fire Company, C. P. Smyker, President, Lewistown, Pa. Brick, steel, limestone, 3 stories and basement, 92x51 feet, metal lath, tile and marble work, terrazzo, hollow metal sash, kalamein doors, iron stairs, ornamental iron work, Johns Manville roof, cement and maple floors, bluestone, excavation, plumbing, steam heat, electric work.

High School (add.), Lemoyne, Pa. Contract awarded W. E. Bushey, Lemoyne, Pa., \$56,000. Electric, G. C. Kinsey, Lykens, Pa., \$1,789. Heating, F. E. Filson, 116 South Second street, Harrisburg, \$9,890. Plumbing, M. H. Baker & Co., 1330 Derry street, Harrisburg, Pa., \$1,225. Architect, C. J. Lappley, Parkside Building, Harrisburg, Pa. Owners, Lemoyne School Board, Mrs. J. E. Beale, President, Lemoyne, Pa. Brick, steel, 1 story, composition roof, maple floors, hollow tile, roof ventilators, bond, metal partitions, steel sash, metal lath.

Apartment House, Highland Park, Pa. Contract awarded P. Beccia, Drexel Hill, Pa. Work started. Architect, A. A. De Porreca, 1713 South Conestoga street, Phila. Owner, C. Petti, Highland Park, Pa. Brick, steel, limestone, 3 stories and basement, 130x28x28x-128 feet, irregular, hardware, plumbing, flagstone, ornamental iron work, bond, tile work, metal lath, slag roof, oak and cement floor.

Warehouse, Lancaster, Pa. Contract awarded D. S. Warfel, 452 North Prince street, Lancaster, Pa. Architect, C. Emlen Urban, Woolworth Building, Lancaster, Pa. Owners, Lancaster Storage Co., 342 North Queen street, Lancaster, Pa. Fireproof, 6 stories, 35x65 feet, slag roof, concrete floors, eleva-

tors, electric light, steel sash, fire doors.

Store Front (add.), 15 Penn Square, Lancaster, Pa. Contract awarded D. S. Warfel, 452 North Prince street, Lancaster, Pa. Architect, C. Emlen Urban, Woolworth Building, Lancaster, Pa. Owner, E. W. Brown, 13½ Penn Square, Lancaster, Pa. Brick, stone, 3 stories, slag roof, rubber floors, roof ventilators, skylights, ornamental iron, bronze work.

Residence, East Market street, York, Pa. Contract awarded C. A. Monk, York, Pa. Architect, H. R. Lenker, 25 North Duke street, York, Pa. Owner, H. M. Plowman, 1239 East King street, York, Pa. Brick, 2½ stories, 36x28 feet, slate roof, hardwood floors, oil burner, electric light, tile work.

Store (alts.), Harrisburg, Pa. Contract awarded George Larson, 1904 Market street, Harrisburg, Pa. Architect, B. E. Starr, 7 South Second street, Harrisburg, Pa. Owner, J. Paul Charles, 1405 State street, Harrisburg, Pa. Brick, concrete, 1 story, 40x95 feet, concrete floors, steam heat, electric light, rolled steel sash.

Residence and Garage, Devon, Pa. Plans in progress. Contract awarded Townsend, Schroeder & Wood, 1700 Sansom street, Philadelphia. Architects, McIlvaine & Roberts, 112 South Sixteenth street, Philadelphia. Owner, Roland E. Lea, care of general contractor. Stone, steel, 2½ stories and basement, 24x137 feet, hot water heat, electric light, slate roof, oak and yellow pine floors.

Store Building, York road, opposite Homestead road, Jenkintown, Pa. Contract awarded Harry Murphy, Willow Grove, Pa. Architects, Seeburger & Rabenold, 1524 Chestnut street, Philadelphia. Owners, Elkins-Shelbe Co., Jenkintown, Pa. Brick, steel, 1 story and basement, 116x40 feet (heating, electric and plumbing reserved), metal lath, tile, marble, rolled steel sash, bond, ornamental iron work,

cinder concrete block, slag roof, cement and maple floors, demolition, excavation, reinforced concrete, limestone, hardware.

Road Work, Pennsylvania. Contracts awarded. Owners, Pennsylvania Department of Highways, Harrisburg, Pa.

Adams County, R-126, Mt. Pleasant, Oxford and Straban Townships. Bridge over Little Conewago Creek. Paul R. Hostetter Co., York, Pa., \$61,647.53.

Bedford County, R-46, Sec. 3A, Hopewell Township. Bridge over Yellow Creek. Whitaker & Diehl, Harrisburg, Pa., \$25,796.35.

Adams County, R-399, Reading Township, East Berlin Borough. Bridge over Conewago Creek. Smith & Fenstermacher, Allentown, Pa., \$54,369.10.

Road Work, Pennsylvania. Contracts awarded. Owners, Pennsylvania Department of Highways, Harrisburg, Pa.

Northampton County, R-517 A-3909-6723, Upper Mt. Bethel Township, Portland Borough. One course reinforced concrete. Collins & Maxwell, Easton, Pa., \$82,314.82.

Armstrong County, R-203, Manor Township. One course reinforced concrete, one bridge. Russell Bros., Youngstown, Ohio, \$192,618.64.

Mifflin County, R-470, Granville Township. Grading and drainage. W. C. Rauch, Northumberland, Pa., \$91,574.22.

Blair County, R-53, Sec. R-2, Juniata Township. Bridge over Gap Run. Clark Bros., Cherry Tree, Pa., \$29,159.34.

Contracts Awarded

Office, Warehouse and Bakery, Washington, D. C. Contracts awarded. Architects, The Balingier Co., Twelfth and Chestnut streets, Philadelphia. Owners, Sanitary Grocery Co., Washington, D. C. Plumbing, Standard Engineering Co., Washington, D. C. Electric, H. P. Foley, 34 South Seventeenth street, Philadelphia. Sprinkler, Globe Automatic Co., 2035 Washington avenue, Philadelphia.

LOWEST BIDDER MAY BE MOST EXPENSIVE ONE

The man who intends to build a house for himself according to his own plans and specifications, should beware of the excessively low bidder. The lowest bidder is not always the best bidder, and this is especially the case where his bid runs very much below that of several other responsible builders who are competing with him for the work. The temptation to "skimp" on a cheap job is great and not always detected by the inexperienced eye. Here are some of the things which the owner risks not getting in a house constructed at the cheap price. First: He does not get good foundations. The sand or gravel is not clean or not sufficient cement is used. The footings are thin and rickety. Separate footings are not prepared for columns. Concrete bases are not devised for setting of wooden posts.

What happens? The walls crack or crumble. The bases of the wooden posts rot. The building settles.

Gets Inferior Walls

Second: He does not get good walls. If they are of wood, the braces and bridging are omitted; if of masonry, the mortar is weak, brick courses are crooked, bricks not fully bedded. Siding used to finish the walls in thin-inferior wood. Adequate insulation is omitted or, if used, is not tightly sealed. Sheathing paper is not flashed around the openings. Joints between courses of paper are not made wind and rain proof. Two nails are used where four should go.

Then the walls get out of plumb. Plaster cracks, mortar washes out. The brick work looks "drunk and disorderly." The siding cracks. Walls collect moisture and heat is lost. The house gets old and cold before its time.

Third: He does not get good beams or joists. Bracing and bridging are omitted. Inferior grades of lumber are used. Sizes are reduced. The sub-floors are not run diagonally. Doubled joists are not run

around the chimney stacks and stair wells or under partitions. Without good supports the floors must sag and creak. Plaster will crack. If the contractors use 2 by 8's in place of 2 by 10's for the second floor joists you cannot find the difference in the lumber bill, but you can find it in the cracked ceilings. Light pieces to support heavy loads cannot be seen when nicely painted over. But they show up later on.

Poor Roof Causes Trouble

Fourth: He does not get good plaster. The lath is not spaced properly for plaster keys. Lower grades of lath are employed. There are no metal re-enforcements at angles and in the corners. Then the plaster is too thin. It is not pressed into the lath spaces. It is not finished straight and true. Tool marks show. The edges of the plaster shows around the casings.

Common plastering is not a fine art, but FINE plastering is not common. On a cheap job it will crack, bulge, come loose, fall off. Poor lath, stains plaster. Where the re-enforcement is omitted there will be a crack. Rough places in the plaster will always show.

Fifth: He does not get good roofing. Thin, flat-sawed wood shingles are substituted for the thick-edge grain quality specified, or lightweight felt and asphalt composition shingles displace the heavier weights of this type of roofing. Metal flashings are not turned under the siding or into brickwork. Drain troughs are of lighter metal not pitched to drain.

Then shingles curl, let water down or catch fire brands and the house burns up or the metal rusts out. The roof leaks.

Sixth: He does not get good painting or paint is put on too quickly or in coats that are too thick. Substitutes are employed. The paint film itself is of poor quality, not brushed into the wood. Nail holes are not puttied up. Sanding between coats is omitted. The paint film

crazes, chips and falls off, collects soot and dust too quickly, knot holes show through.

Seventh: He does not get good millwork. The wood finish is rough and splintery. Pieces that should be locked together are only nailed. Hammer marks show. Doors and drawers do not fit. Stairways are put together with nails instead of wedges and glue. Floor boards are not driven up close together. The floor is not sanded smooth. Wood work is not thoroughly kiln dried. Pieces to be stained are not selected for grain and color. There is as much difference between grades of millwork as there is between automobiles. The cheap contractor buys his where it costs the least. Of course it is splintery, drawers do not pull readily, the stair squeaks, cracks appear between the flooring strips. The wood in the "cabinet work" shrinks and falls apart. Doors peel off.

Inferior Plumbing Costly

Eight: He does not get good plumbing. Joints are not caulked tightly. The piping itself is too thin. Pipes are not properly pitched to drain. The enamel finish on the fixtures is rough and uneven. The frame work of the house is cut for pipes without regard for consequences. Then look for leaks and ruined decorations. Be prepared to call in the plumber to rod out stopped piping, to worry over fixtures you thought were of the best. The hacked out joints may fail.

Ninth: He does not get good heating. The furnace is not set properly. Joints are not made gas tight. The pipes are not insulated. Pipes are not pitched to drain, are too small. Light weight metal is used. It may look like the finest job, but it leaks gas and smoke, ruins draperies, takes more coal to heat. Or the radiators knock—do not heat quickly.

These are only a few of the things he does not get. They are principally matters of workmanship, though in some

cases inferior materials are substituted. Unless the owner is a technically trained man and knows material and workmanship or has some one on the job to represent him who does know these things, the cheap contractor can do his worst without the owner being aware of it.

The lowest bidder may be the most expensive one!

—East Bay Builder.

Citing the recent marked decline in construction activities throughout many sections of the country as offering a very advantageous market in which home owners and especially persons of moderate means can take inventory of their homes and plan a proper modernizing program for the home and its complete equipment, Dwight L. Hoopingarner, Executive of the American Construction Council, made public a statement giving suggestions to home owners on this important phase of building construction. This statement, issued as part of the Council's regular series of articles to the public on better building and reconditioning of homes, says:

"With the seasonal decline in certain major types of building construction, the home owner now has a very advantageous market in which to plan, finance and conduct a thorough home-modernizing campaign at the least cost consistent with good design, good materials and good workmanship. Even a few hundred or a few thousand dollars wisely spent for this purpose, according to the size and requirements of the house, will not only modernize the house but often add greatly to its value. This is of great import-

ance, especially to the home owner of moderate means who cannot afford to buy or build a new home but wants additional facilities.

"Reconditioning or modernizing the homes, properly planned and carried out, serves the two-fold purposes of helping the home owner to conserve the investment in his house as to both its utility and its beauty, and of maintaining a healthy level of activity for the building industry which in turn is so important to the business of the country as a whole.

"In previous articles to the public, the American Construction Council has advised in detail as to what factors should initially be taken into consideration before deciding whether or not it will be profitable to invest much more money in the house; i. e., the general type and location of the house, the class of alterations desired, the relation of the present layout to the desired alterations, and the like.

"If after careful consideration of all such factors involved, it is decided to add to the investment in the house, it is strongly recommended that the service of a reliable architect be secured to draw up the general plans and specifications and supervise the work. The plans, which have to do with the general layout and style of the house, and the specifications, which tell definitely and exactly down to the smallest detail what materials are to be used and what methods of construction are to be employed, are very important. The plans and specifications are parts of the contract which the owner makes with the contractor and which he as the owner cannot afford to agree to until he thoroughly understands them and also knows what everything for the completed job will cost including materials and labor as well as contractor's charges and architect's fees and any necessary financing costs.

"After the owner has decided, with the

help and advice of an architect, what type of alterations are to be made and also determined the general design and exact specifications together with probable costs, it is then imperative that a reliable building contractor be employed on a definite contractual basis with all costs specifically included. Even though the plans and specifications are properly drawn, the man who has immediate charge of the work can still make a good job or a poor job according to the methods he uses in following out these plans. A well designed building is potentially a more valuable property, but only a well constructed building is the reality, and the resale value must be taken into consideration quite as much as present comfort and utility. A good contractor saves both time and money.

"Shopping around for the 'best price' does not necessarily mean the 'best deal.' Full value on the investment can be secured only with quality materials and good workmanship, in addition to good design and proper supervision. While cheap materials may present apparent economy in the beginning, they cause irreparable loss in the future because of heavy repair and upkeep, marked depreciation and low resale value. Proper uses of the various materials and methods of construction are very important. Generally speaking, trade-marked materials nationally recognized as standard are most acceptable and when such materials carry the manufacturer's own guarantee they can as a rule be used with much greater confidence. The home owner must remember that in the end he pays for quality materials whether he gets them or not.

"It cannot be emphasized too much that before starting to remodel, repair or redecorate his home the home owner should not do anything that involves substantial change without employing competent professional advice. The home owner can also get advice from reliable building material dealers, builders and building loan institutions in his community. Various local and national associations of manufacturers and distributors also render valuable service as to the best uses of their materials. Other agencies such as the Home Modernizing Bureaus, The Architect's Small House Service Bureau of the United States, Inc., and the U. S. Department of Commerce, furnish valuable information in their respective fields. A list of such associations and agencies with addresses, is obtainable from the American Construction Council.

"It is perhaps well to repeat that in addition to just what should be done and just how it should be done the home owner should not fail to get definite figures on just what it is going to cost. He should also make certain that everything is included at the outset so that there will be no extras to be thought of afterward and run the cost above what can be

afforded. He should have everything in legal contract form before any final commitment is given. Also, proper provision should be made for the necessary financing of the completed job, which subject will be treated in the next article.

"NOTE: This is one of a series of articles giving detailed discussion of the various things, step by step, for the home owner to consider in reconditioning his home. The American Construction Council, in co-operation with the various branches of the construction industry, conducts a clearing house on information for home owners, builders and lenders of money, as to the best recognized principles and practices on better building and better financing of homes. If you are not certain where to get the right information yourself, write to the American Construction Council, 28 West 44th Street, New York City, telling them the size and kind of house you have under consideration and the general type of alterations you have in mind and they will put you in touch with the best sources of information for your special needs.

A CODE OF TRADE PRACTICE *Proposed for the Structural Steel Industry*

1. Definition

The structural steel industry includes any person, firm or corporation engaged in manufacturing, selling, distributing or erecting structural steel for construction purposes in the United States of America.

2. Proper Designs

It shall be considered unfair trade practice to recognize uneconomic or unsafe structural design. For the purpose of defining that which constitutes "proper" or "improper" structural design, a "proper" design shall fully meet requirements of good engineering practice; all architectural requirements, if any; all local building code requirements, regulations or governmental laws. Design drawings shall be fully dimensioned so as to locate every piece of steel, by at least one set of dimensions. For all classes of structures the various component members and details of design and any information of an unusual character shall be shown in sufficient detail so as to indicate clearly the fundamentals of the design. Design drawings shall be fully checked.

3. Materials

It shall be considered unfair trade practice to use or to substitute materials inferior in quality to those specified by the purchaser or to that required by the applicable governmental laws, rules and regulations in the territory affected.

4. Methods of Manufacture and Erection

It shall be considered unfair trade practice to use methods of manufacture and erection not in accord with the accepted

proper practice of the industry as set forth in the Standard Specifications and Code of Standard Practice of the American Institute of Steel Construction, Inc., or as set forth in the applicable governmental laws, rules and regulations in the territory affected.

5. Unit Prices

It is patent that more intelligent costs can be estimated where the character, scope, quantity and detail of the work is clearly defined. For which reason the industry urges that bids so far as practicable, be made on a lump sum basis from proper designs, but where such bidding is impracticable it shall be considered unfair trade practice to figure the final weight in any other way than the accepted practice of the industry as set forth in the Standard Specifications and Code of Standard Practice of the American Institute of Steel Construction, Inc.

6. Sales Below Cost

It shall be considered unfair trade practice to sell, or offer for sale, material below cost.

7. Dumping

It shall be considered unfair trade practice for steel distributors to sell their products in other than their usual markets at low discriminatory prices so as to restrict competition or create a monopoly.

8. Commercial Bribery

The following methods used for the purpose of effecting or concealing price discrimination, or for other purposes, shall be considered unfair trade practice:

(a) The payment, allowance or acceptance of secret rebates, commissions, credits, discounts or like concessions, whether in the form of money or otherwise.

(b) Understandings to do work or to furnish material on terms other than those set forth in the contract between the parties.

9. Misrepresentation

The following are such misrepresentations as have no place in fair and honest competition and shall be considered unfair trade practices:

(a) Misleading promises of delivery and performance that cannot reasonably be fulfilled and misleading statements of ability to perform work.

(b) Dissemination of information, false or misleading in any degree, relative to competitors' products, selling prices, credit standing, ability to perform work, or labor conditions among competitors' employees generally or in a particular locality.

10. Unrequested Bids

It shall be considered unfair trade practice to submit a bid without having been requested or invited so to do.

11. Check Bids

It shall be considered unfair trade practice to knowingly submit a bid after a contract has been awarded.

12. Reopened Bidding

It is general practice for steel distributors to submit bids to general contractors who in turn use the lowest acceptable price in making up their bids on the general contract. Many general contractors, after securing the general contract, then reopen the bidding and force a second active competition for the same operation, commonly known as "shopping."

It shall be considered unfair trade practice for a steel distributor to submit a bid to a general contractor or to an owner under conditions of reopened bidding as described herein.

13. Published Prices

The industry approves the practice whereby the manufacturers of plain material independently publish and circulate current price lists, and also notices of all advances and declines, and condemns any discrimination in price made to purchasers, whether subsidiaries of the man-

ufacturers or otherwise, after making due allowance for differences in cost of servicing, selling, transportation and for credit risks, as it tends to lessen competition and to create a monopoly.

14. Standard Contract

Whereas, unfair competition in terms, as well as in price, is destructive to any industry and

Whereas, the steel constructor is constantly presented with contracts for furnishing and erecting material containing unfair and inequitable terms which often impose upon him liabilities that are in no way a part of his work, now therefore be it

Resolved, that a committee be appointed by this conference empowered to draft and present to the industry standard proposal and contract forms; and that such committee be ordered to proceed at once to such preparation.

15. Enforcement

Whereas, this industry assembled in this conference is primarily concerned with the future enforcement of the within regulations, and

Whereas, this conference approves the arbitration of controversies between members of the industry and those dealing with it, and

Whereas, complaints of violation of the within regulations should be made to governmental enforcement bodies only after the industry itself has attempted correction, now therefore be it

Resolved, that this conference request the American Institute of Steel Construction, Inc., as the body representing the greater part of the industry, to establish a tribunal to which all violations of these regulations shall be referred in the first instance for investigation and adjustment.

SOUNDPROOFING IN BUILDINGS

By F. R. WATSON, *Professor of Experimental Physics, University of Illinois*

Need for Soundproofing—The problem of soundproofing in buildings has received an increasing amount of attention in recent years, because of the insistence on the reduction of noise. The demand for quiet rooms in hospitals, hotels, and office buildings, the desirability of insulating music studios and rooms where disturbing sounds are produced, and the necessity for solving other problems for the control of noise have led to repeated inquiries by architects and builders for reliable information about effective methods of insulating sound.

Sound Insulation a Matter of Uncertainty—A number of perplexing problems are involved in the practical insulation of sound in buildings. The theory of the subject is incomplete, and practical attempts to secure effective soundproofing are not always attended with success, even though the constructions used are in accord with the theory and apparently have the elements of adequate insulation. Sound progresses with facility through the different solid materials in a building structure, in paths not easy to trace, and may be heard in positions quite remote from this source. This action, together with the extreme sensitivity of the ear, explain why the insulation of sound is a difficult matter.

Two Types of Sound to be Considered—The general problem of soundproofing involves a consideration of two types of sound: first, those that are generated in the air and progress through the air; and second, those that originate and progress in the building structure.

Insulation of Sounds in Air—Sounds

in air may be set up by a violin, the voice, a clarinet, etc., and then proceed outward from the source through the surrounding air to the boundaries of the room. Here the energy may be transmitted to an adjoining room in three ways: first, by passing through the air passages in ventilator pipes or other openings; second, by setting the separating walls in vibration so as to create sound waves on the further side; and third, as an elastic wave motion in which the pressures and rarefactions of the sound waves are transmitted from particle to particle in the wall and are communicated to the air on the further side. Experience shows that the escape of sound is usually greatest through the ventilation ducts, and that, unless these vents are arranged in some special manner to hinder the transmission, it is a waste of effort to install soundproof walls or floors or other special constructions. Next in importance to the ventilation of system, in the transmission of sound, is the vibration of walls. Sound pressures and rarefactions in one room set a wall in mechanical vibration, and the wall, in turn, sets up sound waves in the air on the further side. The action is more marked if the wall is thin or if it is in tune with the sound. The amount of energy transmitted by elastic waves is usually small compared with the transmission by the vents and by wall vibrations.

Sounds in air are quite effectively stopped by fairly rigid walls that do not have openings for pipes or ventilators. Such a wall stops sound because it presents a new medium, varying decidedly in density and elasticity from the air.

Vibrations in the Building Structure—The other sounds to be considered in soundproofing are the vibrations generated in the building structure by motors, pianos, elevators, street traffic, etc. These vibrations travel easily through the continuity of solid materials and, by setting up resonant movements in partitions or furniture, may create sound waves in air.

Insulation of Building Vibrations—It is more difficult to stop vibrations progressing in the building structure than those passing through the air. The effective method of control, as in the case of the sounds in air, lies in the interposition of a discontinuity in the path of the waves.

For instance, an air space in masonry is theoretically an effective barrier because of the marked discontinuity in elasticity and density between masonry and air. Practically, however, this arrangement is not effective because the discontinuity is not complete; the weight of materials necessitating a contact across the air space that allows easy transfer of the vibrations. An approximate solution is obtained, by inserting air-filled materials such as hairfelt, flax, sand, etc., which, while lacking the rigidity of solids,

are still able to sustain a considerable load, and, because of the enclosed air, make a fairly complete break in the continuity of structure. Cork has been extensively used for this purpose because of its semi-rigidity. Other useful materials in this connection are Celotex, Insulite, Flaxlinum, and similar products.

Important Elements in Sound Insulation—According to the foregoing analysis, which is based on the theory of the subject, on experimental investigations, and on a consideration of practical constructions, the important elements to be sought for in soundproofing are:

1. A massive and rigid structure to minimize vibrations.
2. Walls, floors and ceilings that are continuous and sufficiently rigid to prevent transmission of sound.
3. Control of sound in ventilator ducts and other air passages.
4. Control of progress of vibrations in the building structure by means of discontinuities and sound-absorbing materials.

—Isolation.

BOOK REVIEW

Introduction to Business Management, by Herbert G. Stockwell, published by Harper Brothers, is an exhaustive treatise of the many phases of business, including the various types of business enterprises, the general basis of organization, the qualities which make successful executives.

The duties of the many officers, assistants and department heads are analyzed as to work, organization and possibilities for development, including steps that lead to positions of managerial type and then to executive positions of major proportions.

The object of the book is twofold: first to assist young men in business to learn about the jobs higher up, and secondly to stimulate the desire of those possessing managing ability into organized efforts to qualify as managers.

Introduction to Business Management abounds in so many helpful suggestions, so many sound principles that it actually teems with information. Any young man thinking of going into business cannot fail to accumulate endless help by carefully reading this invaluable volume on business management.

The liberal education contained in this book is a guide not only to young men starting in business, but many so-called executives can gain useful information that will help in the correct practices of business and business administration. The price of *Introduction to Business Management*, \$4, is trivial when the innumerable lessons and solutions of business difficulties and problems are considered. Individuals, firms, corporations of whatever kind, can profit greatly by having this book in their libraries as constant reference.

COMMERCIAL ARBITRATION TRIBUNAL FOR THE ENTIRE INDUSTRY NOW OFFICIALLY ESTABLISHED

At a regular meeting of the Committee on Commercial Arbitration of the Philadelphia Building Congress, held in Room 705, Manufacturers' Club at 2.00 P. M. on October 17th, 1929.

The following members were present and voting: Vice Chairman J. H. LaBrum, D. K. Boyd, D. F. Durkin, Jr., James Hamilton, J. G. Hitner, W. C. Smith, S. M. Swaab, Pope Yeatman, and Secretary H. J. Baringer. Regrets were received from Messrs. P. N. Arnold, E. M. Bassett, J. D. Cassell, F. G. Stewart, Wm. M. West and Chairman W. M. Conlen, who is now in Europe. The following were also present as guests: Messrs. F. M. Venzie, Warren Armstrong and Alfred Volker, Jr.

Vice Chairman LaBrum then read paragraph at a time, the first of the documents necessary in setting up a tribunal to function in accordance with the latest act of Pennsylvania Assembly. This is entitled

Regulations in Conduct

Discussion of these regulations was led by Mr. Durkin and after the fullest consideration and incorporation of minor changes, on motion of Mr. Durkin, seconded by Mr. Boyd, these regulations, as revised, were *unanimously adopted*.

The Secretary then handed the members present copies of the second document for the procedure of the Arbitration Committee entitled

Sets of Rules

Vice Chairman LaBrum read these by sections and following discussion, the same were, on motion of Mr. Durkin, seconded by Mr. Swaab, *unanimously adopted*.

The Vice Chairman then read a suggested

Specification and Contract Clause for future use and, following further valuable discussion, it was, on motion of Mr. Hamilton, seconded by Mr. Durkin, *unanimously adopted* with a recommendation that this clause be referred to the Congress' Committee on Contractual Relations for separate promulgation and added recommendation to all interests involved.

The Vice Chairman then referred to and presented in order, for use in any controversy now under way, a form of

Submission Agreement and Forms of Affidavit

for individuals, partnerships and corporations. It was, on motion of Mr. Swaab, seconded by Mr. Castor, *unanimously voted* to adopt these standards for submission and affidavits and that these standard forms be referred to the Congress' Committee on Contractual Relations for

such promulgation and advancement among all interests involved as they may deem advisable.

The Secretary then presented a list of those Associations and Organizations which had submitted names for the

PANEL OF ARBITRATORS

These consisted of 17 groups who had proposed the names of five of their members who would serve on a Panel of Arbitrators for the building industry when appointed by this Committee. It was, on motion of Mr. Swaab, seconded by Mr. Boyd, *unanimously voted* to appoint each of these men as recommended by these several organizations to the Arbitration Panel of the Congress and on further motion of Mr. Hitner, seconded by Mr. Yeatman, it was *unanimously voted* to confer on the Vice Chairman and Secretary, with power, the appointment of any additional persons to the panel when and as names are received from other recognized organizations allied with the building industry.

Mr. Swaab raised the question as to the election of a permanent Secretary of the Tribunal and it was unanimously voted to elect Mr. H. J. Baringer as the Tribunal Secretary.

On motion the meeting then adjourned at 3.45 P. M. with a rising vote of thanks to the Vice Chairman and the Secretary and with a universal expression of opinion that a most important step had been taken in benefiting all elements in the building industry.

Modern life, requiring as it does a multiplicity of types of structures, can be best served with structural steel. This, in short, will be the substance of a series of technical studies which are to be presented before the Seventh Annual Convention of the American Institute of Steel Construction when it convenes at Biloxi, Mississippi. Bridges, dams, power plants, factories, churches, theatres and other structures are all most economically erected with structural steel.

Henry Goldmark, consulting engineer of New York, who was among the first to use steel in building bridges, and who is most famous for having designed the lock gates of the Panama Canal, will discuss the use of structural steel in dams.

D. B. Steinman, consulting engineer of New York, who is internationally famous as an authority on long-span bridges, will discuss the problems of bridge engineering and their special application to structural steel.

Kenneth G. Merriam, assistant professor of applied mechanics at Worcester Polytechnic Institute, will present to the convening steel constructors some new light on the design of column slabs which he has been working out during the past year or two in association with Donald G. Downing, of Worcester.

Insurance
Company"*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

MERCHANTS NATIONAL BANK
SAN BERNARDINO, CALIFORNIA

**"ANTI-HYDRO" Pays
Dividends in this Bank**

HOWARD E. JONES, . . . ARCHITECT
GENERAL CONST. CO. . . CONTRACTOR

The concrete foundation walls below grade and the basement floor slab in this bank are waterproofed with "ANTI-HYDRO". As a result, the basement is **permanently dry**.

"ANTI-HYDRO" is especially valuable for waterproofing bank basements where storage vaults and safe deposit boxes are installed. Dampness rusts reinforcing, tarnishes silverware, and rots and disintegrates valuables such as are usually stored in vaults. "ANTI-HYDRO" prevents dampness, regardless of how wet the ground surrounding the building may be. And it hardens concrete at the same time in waterproofs—insuring dustless floors that cannot chip or rut.

"ANTI-HYDRO" is extremely easy and economical to use and results are **guaranteed**. Being a liquid integral compound, it can be added to the water used in wetting down concrete mixes—without the aid of skilled labor. It accelerates the set of cement and saves finishers' time. It increases the strength of concrete and insures uniform hardness throughout.

For 25 years "ANTI-HYDRO" has been producing highly satisfactory results for architects, engineers and builders the world over. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Stores and Office (alts.), 1914-16 Broadway, N. Y. Architects taking bids due November 23rd. Architects, Stuckert & Co., 362 West Fiftieth street, New York City. Owner, Elizabeth B. Hellman, 71 West Forty-fifth street, New York City. Lessees, Bickford's, Inc., 362 West Fiftieth street, New York. New granite, 3 stories, 58x50 feet, bronze bulk window construction, new partitions, plumbing, carpentry work.

College Building, \$300,000. Washington, D. C. Preliminary sketches drawn. Architect, Paul A. Monaghan, 1520 Locust street, Philadelphia. Owners, Augustinian College, care of Rev. Daniel A. Herron, O. S. A., Provincial Father, Villa Nova, Pa.

High School (add.), Dover, Kent County, Del. Owners taking bids due November 22nd, at 3 P. M. Architects, Frank R. Watson and Edkins & Thompson, 1520 Locust street, Philadelphia (note architects' names). Owners, State School Building Commission, Dr. H. V. Holloway, Superintendent, Board of Education Building, Dover, Del. Brick, east stone, steel, 2 stories and basement, 64x35 feet, es-

timate No. 2; estimate No. 1, 2 stories and basement, 32x35 feet; Barrett specification roof, maple and cement floors, steam heat, electric light, metal lath, steel sash, bond, ornamental iron, reinforced concrete, excavation, metal partitions, carpentry, mill work, hardware, painting, glazing, plumbing. Certified check, 5 per cent. of bid or bid bond. \$25 deposit (refunded). Bid No. 1, 3-room addition. Bid No. 2, 6-room addition. (Note correction.)

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C. Nov. 18, 1929.—Sealed Bids will be opened in this office at 3 p. m., December 19, 1929, for construction of the U. S. post office at Tyrone, Pa. Drawings and specifications, not exceeding six sets, may be obtained at this office in the discretion of the supervising architect by any satisfactory general contractor, and provided a deposit is made of \$15.00 for each set to assure its prompt return. Checks offered as deposits must be made payable to the order of the Treasurer of the United States. JAS. A. WETMORE, Acting Supervising Architect.

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood, and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

In a consensus opinion representing leaders from all component parts of the construction industry throughout the nation including banking, architects and engineers, real estate, manufacturers, material supplies, transportation agencies, contractors and labor, the American Construction Council recently in a statement issued through its Executive, Dwight L. Hoopingarner, declared the present situation in the speculative securities market shows the need for the American investing public, and especially persons of moderate means, to return to the fundamentals of sound investment practice and urged the wider employment of investment funds in the legitimate phases of building operations, also giving suggested safeguards for making such investment. The statement in full says:

"Recent developments in the speculative securities market demonstrate once again the need for an active and continuous recognition on the part of the American investing public, and especially persons of moderate means, of the principles of sound investment practice based upon real utility and stable values as found for example in the legitimate phases of building operations. The investing public can do well to employ regularly a much greater portion of its funds, largely diverted the past year into speculative channels, in the ownership of its own homes or in conservative mortgages or other prime securities in properly conceived and properly conducted buildings or other construction projects that serve necessary purposes, such as home building or modern industrial structures or needed public improvements. This will

not only serve the purpose of sound investment but greatly help in preventing possible unemployment in the building trades and also in the many lines of industry and commerce that in turn feed the construction industry itself or follow in its path. New construction of the right kind, as well as rebuilding and remodeling of basically well-built business structures serving a useful purpose and the modernizing of homes and home equipment, can be very advantageously conducted with these purposes in view at this time. The present seasonal decline in building activities also offers a good building market for these purposes.

"This does not mean that the public should blindly encourage all sorts and kinds of building, for as the American Construction Council pointed out in a note of warning sounded during the onrush of the construction boom over six years ago, unrestricted speculative building is itself a real danger and certain basic requirements are as necessary for safe building investment and home ownership as in other major fields of investment.

"The lone investor, of course, cannot always make a direct personal investigation of all factors entering into a particular building investment, but he can take precautionary steps to learn from the loaning institutions and through other appropriate channels such as his own bank that such factors are being cared for and should insist upon being fully acquainted with those factors before putting his money into building or real estate securities. He should also acquaint himself thoroughly with the general details of

mortgage bond procedure and other forms of real estate securities. Every building must be considered as a separate problem, but it is generally acknowledged that there is no class of commercial investment safer than the right kind of mortgage or other real estate securities.

"Among the more important requirements to be borne in mind by the Building investor are the following: First, remember that for sound investment both safety of the principal and return on the money invested are essential, the problem being to get the proper balance between these two factors in each particular case for as the former increases the latter tends to decrease. Second, deal only with reliable investment houses or other reputable independent sources. Third, consider the purpose of the building bearing in mind the future as well as the present demand for such a building with respect to its possible earning capacity. Fourth, consider the location of the building as related to its use bearing in mind the possible future shifting of business and residential centers. Fifth, make sure that the general type and design of the building harmonizes with its purpose and its location. Sixth, make certain that the quality of construction is good both as to materials and workmanship throughout with regard to the purpose intended to be served by it, and that the improvement is an economical one for this purpose, insisting that reliable architects and contractors have charge of the construction and that they use only quality materials. Seventh, carefully consider the earning capacity of the building for the future as well as for the present, including not only the cost of construction itself but also the cost of the land and other financing, taxation, assessments, and the like, and the future market conditions for the type of occupancy that the building is intended to serve. Eighth, a point frequently overlooked is that the investor should insist upon a high character of management for the building after its completion, making certain that the terms of the loan on the building require that the owner provide and maintain first-class supervision of the building in every way over the entire period of the investment.

"When such basic requirements are once met, no field of industrial activity can do more to stimulate and permanently maintain the prosperity of the nation than does the construction industry in its many phases, for since construction both creates and maintains wealth it is a national asset of the first magnitude in character as well as volume of wealth produced by it. Its influence reaches from the raw materials at the mine or quarry or clay bank or forest through the factories and agencies of transportation to the final installation of the finished materials in the school, courthouse, store, factory, high-

way or home. It also stimulates the many allied lines of commerce and industry that follow along with construction, as for example house furnishings, school and office equipment and the like. Better construction conditions, therefore, mean better business for everybody, and the public can with advantage to all concerned put its money into the right kind of building investments."

SET-BACKS? YES. What have set-backs to do with the matter of structural designing? Aplenty. But it is merely a matter of engineering design according to the ordinary laws of the art—that is all.

GRANTED THAT the engineering problems involved in set-back construction are solved by applying the ordinary laws of the engineering art, what of it? Instead of the old style building in which the running down of the column loads from top to bottom was a simple arithmetical calculation and the floor framing was typical, it is far different. Offsetting the columns at the set-backs not only requires an irregular distribution of loads but it necessitates the designing of special set-back girders and special provisions for properly transmitting the wind stresses.

ALL OF this unusual construction requires special details and sections, a greater number of and more intricate calculations, time, study, knowledge and experience—all of which costs money.

THAT ISN'T ALL. Forget about the extra labor and cost of designing—there is the other item of dimensioning the plans. Any tyro can readily see the increased complications of dimensioning the set-back job.

AND NOW the aesthetic architectural design. What is that? Let me tell you. The architect, having eliminated the flat ceiling, needs to have the exposed ceiling beams spaced accurately between the walls of the room, or, the edge of the beam plastering must coincide with that of the partition below. Clearance must be provided for pipes, ducts and shafts. Construction must be concealed. In fact, the engineer must juggle the steel so as to accommodate it to the most exacting demand of the architect.

ALL OF this may produce eccentric column loads—it usually does. These must be calculated and provided for in the column section. It also produces unusual bending moments in the girders and beams which require special consideration and design—and all the time watch out that every pound of steel and every rivet does all the work that the law allows.

NOT ONLY is the designing more complicated but the dimensioning becomes something fierce. The cost of dimensioning very often exceeds the cost of designing—and all for the price of one. It takes time to line up the steel

with the work to be done by others. Not only must the other parts of the structure be clearly defined so as to properly locate the steel but the closest co-operation must be maintained with the architect and many of the subcontractors so that perfect co-ordination is secured.

NO ONE objects to the hard concentrated effort required to produce correct engineering designs. That is part of the game, but the work is justly entitled to a profitable compensation. It is doubtful if the engineers, co-laborers, architects, mechanical engineers, contractors and subcontractors fully realize the amount of labor and cost required to attain this perfect co-ordination of the multitude of elements that comprise the modern building.

SURELY A better understanding of the structural engineer will develop a more rational relationship between him and all the others. This may sound too altruistic for this day and age. But is it? Who is damaged if the other fellow enjoys a profitable business? What can you profit by gypping the other fellow? Can any social state prosper when undue advantage is taken of one or several professions, occupations or trades?

IT IS to explain some of the new conditions that are caused by the new type of buildings in designing and dimensioning that mention is made of them at this time.

CAN YOU prosper having incorrect

relations with your fellows and will your building stand up with an inadequate structural frame? Then why not admit that:

Correct relations are the bases of social and economic welfare.

On the structural frame hang all of the building and its contents.

Although American domestic ambition has led to the relinquishment of modest led to the relinquishment of modest homes, and the old fashioned idea of systematically paying off the mortgage has been superseded by a scramble for houses that feature three baths and four mortgages, foreclosures are surprisingly few and will decrease in the future, said William H. Kingsley, vice-president of the Penn Mutual Life Insurance Company of Philadelphia, before the Sixteenth Annual Convention of the Mortgage Bankers' Association of America.

Speaking on mortgage investment problems of life insurance companies, Mr. Kingsley said that there is a tendency on the part of the public to undertake home ownership with too little equity so that the home is endangered when family illness or unexpected expense throws them out of gear financially, and he warned his audience of mortgage bankers from every part of the country against handling junior mortgages on such properties.

He also scored elected tax officials who extend leniency to residential property

owners in the matter of payment of taxes because they know the mortgagee will ultimately settle these bills, and said that such extensions encourage home owners to jeopardize their holdings.

The speaker who represents one of the largest insurance companies in the world with assets of millions of dollars touched on the stock market situation and stated that the break in the market has not destroyed money but has dissipated the froth of artificial values.

Describing a survey of foreclosures, as compared to mortgages, held by a group of the largest life insurance companies in the United States whose assets are close to \$13,000,000,000, and who hold more than \$5,500,000,000 (five and a half billion) of mortgages in all sections of the country, Mr. Kingsley said that the percentage of foreclosed real estate to mortgages owned average 1.26 per cent.

Describing this ratio as surprisingly low, the speaker stated that sales in process now and plans contemplated for the future are likely to decrease this figure.

"There is a growing acceptance in the belief of what may be termed the 'law of periodicity,'" said Mr. Kingsley. "We all recognize that investment urge and popularity move in cycles. Within our own lives we have seen stocks, bonds, mortgages and real estate take turns in occupying the high spot of attention from investors. Each has had its peak of prominence and attendant profit and later become the object of neglect and distrust, largely because they could not stand up under the strain of expectation optimistically imposed by the borrower.

"It should be kept well in mind that the break in the stock market last week, while very disturbing, did not destroy money. It caused the froth of artificial value to disappear and revealed the substance. The real money involved has been redistributed and is now more widely

held by those who will seek more staple forms of investment; such as mortgages and well seasoned bonds.

"Before there can be a resumption of heavy trading in stocks, there is much underbrush to be cleared away. It is significant that, as in all times, life insurance stands out as an asset that has not depreciated.

"The loyalty of the farmer in the face of existing temporary hardships calls for our highest and most sincere admiration. He knows that the sun is just behind the clouds and that it will shine on him again if he is patient. Agriculture will always be the world's greatest industry and it is too basic to ever go bankrupt."

In recognition of the desire of architects, building contractors and owners for a definite time guaranty on all building materials, the Rubber Flooring Manufacturers' Division of The Rubber Manufacturers' Association has adopted the following guaranty on rubber tile flooring:

"We guarantee our product against defects provided our recommended cleaning instructions are followed and we will repair or replace any such defective product which is brought to our attention, in writing, within one year after date of completion of installation. We do not accept responsibility for any damages arising from defects or dampness in sub-floors or other surfaces which may occur after completion of installation."

This guaranty takes the place of any and all guaranties or warranties previously supplied. The new guaranty applies to all installations supplied by the manufacturers from September 25, 1929.

To obtain the most satisfactory results from oak floors, care should be taken in

the laying of the sub-flooring, the Oak Flooring Manufacturers' Association announced in a statement analyzing causes of complaints.

No matter how expensive or well constructed a house may be, it will not stand up satisfactorily if it does not have a good foundation. The same thing, the association says, is true of floors. If they have poor foundations in the way of rough, uneven or poorly nailed sub-flooring, they are likely to give trouble, whereas if the sub-flooring is properly put down, an oak floor should give perfect satisfaction and last indefinitely, the association said.

"In the last few years members of our association, who comprise nearly the entire oak flooring industry, have received several complaints about squeaky floors," said the association's statement, issued by W. L. Claffey, secretary. "These complaints represented an almost negligible proportion of the oak flooring laid, but we were satisfied there was something wrong with installation methods, so each complaint was investigated.

"In every instance we found the trouble was not with the oak flooring, but with the sub-flooring. Sometimes cheap second-hand lumber was used between the joists and the oak with the result that the sub-flooring was uneven. Again knotty lumber was used and the nails would not hold. And on several occasions we found that a good sub-flooring had been laid but that it had been covered by cement and mortar in the building operations and had not been properly cleaned before the top floor was put down."

On one inspection there were squeaks in all rooms. The Inspector nailed certain places through the face to eliminate them, but the squeaks remained.

Going to the cellar he found that the 10-inch shiplap laid diagonally, had been used for sub-flooring. The upper lip of the shiplap had raised up after being exposed to the elements before the roof was put on. Of course that resulted in an uneven sub-floor and the floor squeaked. Describing the proper method of laying sub-flooring in order to prevent squeaks, the association statement said:

"The sub-floor, preferably of 1x6 inch boards, should be laid diagonally. The boards should be surfaced four sides—not tongued and grooved—and should be thoroughly air seasoned when laid and kept dry. Drive two nails at each joist to keep the boards from warping.

"Before putting down top flooring, be sure sub-flooring is clean. Small particles of cement, mortar or dirt falling on it during the building operations will create an uneven surface if they are not removed. Concrete form lumber should not be used.

"It is well to use damp proof paper between the oak flooring and the sub-floor. Do not use ordinary building paper or rosin sized paper. The quantity required is small and the very best quality of damp proof stock should be used. This will prevent dust as well as moisture coming through the floor from the basement.

"Where sound-proof results are desired, a heavy deadening felt is recommended.

"It is very important to leave about $\frac{1}{2}$ inch space on all sides between the oak floors and the base board to allow for expansion in event that any dampness later gets into the oak flooring. This opening is covered by the quarter round or base moulding."

The statement explained that the laying of the sub-floor diagonally gives strength to the structure and permits the oak flooring to be laid in either direction.

In laying the oak flooring, nails should be driven through the side, just above the tongue, at an angle of about 50 degrees. After laying and nailing three or four pieces use a short piece of hardwood about 2x4 placed against the tongue and drive it up. Care should be taken in driving up $\frac{3}{8}$ inch flooring not to break the tongue which is fragile. Also do not drive up excessively tight.

The statement said that when oak flooring is laid over old floors it should be put down at a right angle to the old boards and that the old floor should first be made smooth.

ASH-CANS FACE OBLIVION

The ash-can is facing extermination, starting in the cellars of office buildings, theatres, hotels, apartment houses and the boiler rooms of factories and such places. Ashes now can be removed expeditiously and economically, with a minimum of labor and with no diffusion of dust, by an electric-pneumatic suction system through a pipe-line reaching from sidewalk to ash pit.

The equipment comprises an ash-handling truck containing a large hopper into which the ashes are drawn by suction, and from which they are conveyed by a totally-enclosed belt-conveyor to a carrier-truck which takes them away.

The ash-handling truck is equipped with the gas-electric drive now in wide use for heavier vehicles and already introduced for automobiles of the ordinary type. Power for operating the suction system and the conveyor-belt is obtained by connecting the electric generator to the proper motor and running the engine at suitable speed while the truck is parked.

The first of these new ash-handling trucks has been put in service in New York City by the Pneumatic Conveyors

Corporation. It was designed and built by the American Car and Foundry Motors Company, and was electrically equipped by the General Electric Company.

The suction is provided by a centrifugal compressor, rated at 6,000 cubic feet per minute at a speed of 3500 revolutions per minute and driven by a 40-horsepower motor. The truck is equipped with piping capacity permitting a suction of 2800 cubic feet per minute, equivalent to a velocity of 145 feet per second in the intake pipe. This means that ashes equivalent to the contents of a dozen standard ash-cans can be drawn up every minute to a distance of 30 feet.

Later there will be undertaken the design of a smaller unit, provided with a flexible pipe-line, which can be used for removing ashes from the cellars of residences. These present unit, intended for large buildings, is equipped with a permanent rigid pipe-line, extending from sidewalk to ashpit.

The conveyor truck connects to this pipe-line at the sidewalk opening by means of a pipe section attached to the truck and connecting to the hopper. This pipe section is lowered into place and tightly connected at the sidewalk opening by means of a pipe section attached to the truck and connecting to the hopper. This pipe section is lowered into place and tightly connected at the sidewalk with the permanent pipe-line so that no dust escapes to the outside air at any point.

In addition to the removal of ashes from cellars, the pneumatic conveyor truck can function with efficiency and economy in unloading coal barges. In that field of application it is expected the truck will prove as useful in proportion as in the elimination of ash-can handling and dust-filled air which are now aggravating accompaniments of the removal of ashes from cellars in cities and towns.

ECONOMIC FACTORS IN DEVELOPMENT OF SAND AND GRAVEL PROJECTS

While the production of sand and gravel in this country has shown a tremendous increase in recent years and the construction program of the Nation will naturally call for enormous quantities of these materials in the future, there are various economic factors in the development of new sand and gravel projects which should be given serious consideration by the operator if financial profit is to be assured, says the United States Bureau of Mines, Department of Commerce.

At the present rate our sand and gravel reserves are being depleted at the rate of more than 4,000 acres per year, states J. R. Thoenen in Economic Paper 7, just published by the Bureau of Mines. This would be infinitesimal if all the area known to contain sand and gravel were composed of commercial deposits. Much of this area is known to be patchy, as small deposits of good material are mixed with larger deposits of low-grade material. Also, much of it is at too great a distance from consuming centers, but as new roads and railroads are built it will become accessible to markets of the future.

Such a large increase in volume in any industry would inevitably encourage the development of new production either in the expansion of going concerns, the starting of new operations, or both. The apparent ease with which new sand and gravel operations can be started greatly facilitates this expansion.

Sudden and rapid expansion has undoubtedly resulted in the creation of new projects in the sand and gravel business without adequate study of economic conditions. A survey of the situation made

by the Bureau of Mines indicates that production over the whole country has not yet reached saturation. Curves for individual States, however, tell a different story and indicate that the local situation is rapidly approaching a condition of saturation, if not overproduction.

Sand and gravel are disintegration products of various rocks. Disintegration starts with the solution of various mineral constituents of the rock by surface waters and is assisted by the disruptive action of freezing. Abrasion during transportation by running water and glaciers continues the crumbling and results in fragmentation ranging from boulders to fine silt.

Sand and gravel transported by running water would be more or less classified into sizes were it not for the complications induced by flood conditions. Even then such deposits often exhibit decided differentiation in sizing.

Glacial action, on the other hand, by carrying a heterogeneous assortment of material and depositing it all in one locality, leaves a complicated mess of all kinds and sizes of material. The origin of any local deposit, therefore, is of considerable economic significance.

Where a demand for a certain class of sand or gravel exists without adequate supply, perusal of State or National geologic reports may uncover a near-by source. Study of these reports may also uncover information pointing to certain characteristics of a deposit rendering it applicable to specialized market. By obtaining the geologic reports covering a particular vicinity one may learn whether a sand and gravel deposit is of glacial or steam origin, and, therefore, whether it is apt to contain a partly classified prod-

uct or a heterogeneous mixture of all sizes and classes of material. If of stream origin, it may contain sands peculiarly suited to certain special markets. If of glacial occurrence, further exploration for a special kind of material may be useless, and thus considerable time and expense may be saved.

The beds of streams, lakes, and oceans form potential sources for sand and gravel and a large proportion of our production comes from such sources. A search along the banks of streams or lake and ocean beaches is entirely in order for preliminary survey. Dredging operations many times divulge workable deposits. In streams, sand and gravel deposits are most likely found on the inner side of bends and may often form the bank on that side.

In searching for sand and gravel deposits one can not confine his hunt to bodies of water, however, and many sand and gravel deposits, while originally water formed, were deposited so long ago that all evidence of the depositing agency has vanished. Here again a study of geologic data is invaluable. The geologist, from his general knowledge and specific studies, can trace the courses of prehistoric rivers and predict the occurrence of gravel deposits.

The quality of any particular deposit depends on the origin of the materials that compose it and also the distance and manner of travel. Thus, glacial action may have carried quantities of the harder rocks, such as basalt, granite, and quartzite, for a long distance and then picked up sandstone, limestone, and shale, mixing them unevenly and depositing them together.

Probably the four largest markets for sand and gravel are for use as concrete

aggregate, road material, railroad ballast, and building sand.

The suitability of the product for a concrete aggregate depends on the nature of the construction. Large massive foundations do not require as careful and elaborate specifications as reinforced concrete building construction.

Engineers are as exacting in concrete road work as in reinforced concrete building constructions as to aggregate specifications. The prospective producer must make careful inquiries and find out the particular requirements of the territory he desires to serve.

Sand and gravel is used in three ways as a road material: (1) As a concrete aggregate; (2) mixed with some bituminous material; and (3) in the raw state for gravel roads or as a subbase for other surface material.

A large percentage of the gravel produced is used as railroad ballast. The various roads differ considerably in their specifications for this material, some requiring a washed gravel and others accepting bank-run material containing considerable clay.

Building sand is usually classified as material passing a one-quarter inch screen, but recently engineers have become more critical, and the finer particles or dust must first be removed by a suitable washing process or some other method. The shape of the sand grains is sometimes specified, rounded or weathered grains being preferred to sharp-edged or angular material, and vice versa, although this applies more to special sands. Specifications for building sand at the present time almost universally require washed material.

The demand for an adequate supply of sanitary water for domestic purposes in cities and rural communities has created a large market for certain classes of sands suitable for filter purposes. These sands should be of uniform grain size within certain limits so as to allow a maximum pore space for rapid filtration. They should also conform to certain chemical requirements, as certain mineral constituents possess better filtration properties than others.

Brass and steel foundries require large amounts of moulding sand which must satisfy another set of specifications both as to grain size and composition. Also, molding sands for iron and steel differ in certain respects from those used for brass.

Other special sands, either because of special treatment of one kind or another, or because of their chemical composition, are peculiarly adapted to certain uses. Examples of these are glass sands used in the manufacture of window, plate, and bottle glass and engine sands used in large quantities by railroads and electric line.

Before he enters the business the prospective sand and gravel operator should investigate and assure himself with regard to all the following points:

The deposit should be sufficiently large and uniform.

The market should be able to absorb the proposed tonnage in addition to that which will be furnished by existing sources of supply.

The deposit should yield material of a character that the market will accept or it can be made to do so economically.

The current prices and probable demands should be such as to indicate that the product can be sold for enough to cover not only operating but also overhead costs and in addition should yield a reasonable profit.

The method of excavation chosen should be economically suited to local conditions.

Enough capital should be available to cover initial investments in land and equipment and also to provide working capital during the early stages of operation.

Further information is given in Bureau of Mines Economic Paper 7, "Economics of New Sand and Gravel Developments," which may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., at a price of 15 cents.

The increasing importance of structural engineering is caused by the modern building's enormous size, complicated construction and tremendous cost, and the responsibility for safe and economical construction. This makes it desirable under some conditions for the owner or investment banker to be assured of the adequacy and economy of the design. It is, then, their privilege to have the designs checked by a competent engineer acting as a consultant in the same manner as the architect's plan arrangement may be studied by an experienced renting agency or building manager. To such a procedure there is no reasonable objection.

It is incumbent, however, upon the consultant so retained to conduct the investigation in such a manner as to maintain an ethical attitude towards and not covertly and intentionally injure the original engineer. The consultant must limit his study to the designs submitted and maintain an impersonal attitude thereto. Should a difference of opinion or interpretation arise, it should be settled between the two parties if possible without reference or mention to any other parties. The purpose of both should be confined to producing a perfect design and rendering a complete service to the owner.

Among honorable engineers this is the manner of conducting their business, and with very rare exceptions the association

is terminated with mutual respect and cordial good will. There are instances, however, where the consultant deems it advisable for his selfish interest to insist on alteration, very often inconsequential, and to report the same to his client. The client has no knowledge of the real importance of the matter and may be unduly impressed with the ability and acumen of his consultant. This naturally redounds to the consultant's credit and prestige.

Egotism is not always the only motive for such a policy on the part of the consultant but it often is employed to destroy the confidence of the owner or investment banker in the original engineer and supplant him if possible. The consultant has the whip hand because he enjoys the entire confidence of the owner or investment banker and the original engineer may suffer an injustice in ignorance of the hidden influence against him.

It is only human—all bosh! Of all men we expect the engineer from the very nature of his business and its tremendous responsibilities to be competent, fair, unbiased and honest. Such qualities must engender characteristics of unselfishness and tolerance towards others, competitors or otherwise. To the credit of engineers as a body of professional men this is true.

Owners and investment bankers can have no desire to knowingly injure any person. In employing a consulting engineer it is for the sole purpose of conserving the property and investment. Is it then not incumbent on the employers of consulting engineers to exercise great judgment and care in selecting them? Select them not only for their real knowledge and experience but also for their fair dealing with their fellows. The man who is admired by his competitors is generally a pretty decent fellow and worthy of confidence.

Local professional organizations differ from national organizations in that the local organizations set up certain regulations pertaining to professional ethics which are suitable for local conditions. Unfortunately some few men do refrain from affiliating with such organizations and still observe correct relations with their fellow professionals and their clients. The non-membership of such men is a distinct disadvantage to the profession. On the other hand, other refuse to affiliate with the local professional organizations, so that they may be free to indulge in unethical conduct without censure. These persons are a real menace to the maintenance of a high standard of professional knowledge, service and responsibility.

We would hesitate to employ attorneys and physicians who are not affiliated with their local professional organizations. Why should the building owner or investment banker be less particular

about the affiliations of his consulting engineer?

Correct relations are the bases of social and economic welfare.

On the structural frame hang all of the building and its contents.

STOP, LOOK AND CONSIDER

Michigan has a marriage law which provides that five days must elapse between the date of the taking out of a marriage license and the performing of the marriage ceremony. The idea is, of course, to permit the contracting parties fully to make up their minds that they really want to be married.

Under its operation the first year in Detroit alone more than 1,000 couples changed their minds within this five-day period. And saved a lot of grief.

Some such protective provision should be inaugurated for inexperienced prospective home builders. It would likewise save a lot of woe.

Too many people build houses without knowing how, or why they use this, that or the other material. And suffer endless expense in consequence.

It would be fine if they could be induced to consider seriously the merits of materials before they decide just what they are going to use.

—*Building Economy.*

STILL A SAFEGUARD

Centuries ago a visiting potentate marveled at his royal host's lack of walled defenses about his city and voiced his wonder at this seemingly rash ignoring of the usual precautions. But the king only laughed in confident indifference.

According to the legend they were reviewing his legions, armed to the last word and ready for whatever might come. Waving his hand at the far flung ranks of his cohorts the king remarked something to the effect that there were his defenses, every man of them *a brick*.

That was a double-barreled compliment and down all the intervening ages it has been accepted as an expression of the highest esteem when applied to any man regardless of his walk in life.

The inference that the brick was a safeguard par excellence was unquestioned. The Chinese emphasized this in a manner practical and unmistakable.

Nor is it less a safeguard today against fire and deterioration and heat and cold which constitute in present-day life the home owner's chief menaces.

The brick has stood the test of time from whatever angle one cares to view it.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

**"ANTI-HYDRO" Pays
Dividends in this Bank**

The concrete foundation walls below grade and the basement floor slab in this bank are waterproofed with "ANTI-HYDRO". As a result, the basement is **permanently dry**.

"ANTI-HYDRO" is especially valuable for waterproofing bank basements where storage vaults and safe deposit boxes are installed. Dampness rusts reinforcing, tarnishes silverware, and rots and disintegrates valuables such as are usually stored in vaults. "ANTI-HYDRO" prevents dampness, regardless of how wet the ground surrounding the building may be. And it hardens concrete at the same time in waterproofs—insuring dustless floors that cannot chip or rut.

"ANTI-HYDRO" is extremely easy and economical to use and results are **guaranteed**. Being a liquid integral compound, it can be added to the water used in wetting down concrete mixes—without the aid of skilled labor. It accelerates the set of cement and saves finishers' time. It increases the strength of concrete and insures uniform hardness throughout.

For 25 years "ANTI-HYDRO" has been producing highly satisfactory results for architects, engineers and builders the world over. Use it on your next job.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

Proposals

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., November 23, 1929.—Sealed Bids will be opened in this office at 3 p. m., January 6, 1930, for the demolition of old and the construction (except elevators) of new six story, basement and sub-basement stone faced, fireproof, U. S. post office building, approximately 233 feet by 278 feet ground area, at Baltimore, Md. Drawing and specifications, not exceeding six sets, may be obtained at this office in the discretion of the supervising architect by any satisfactory general contractor, and provided a deposit is made of \$50. for each set to assure its prompt return. Checks offered as deposits must be made payable to the order of the Treasurer of the United States. JAS. A. WETMORE, Acting Supervising Architect.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., November 25, 1929.—Sealed Bids will be opened in this office at 3 p. m., December 26, 1929, for remodeling and enlarging the U. S. post office, Corning, N. Y. Drawings and specifications may be obtained from the custodian of the building, or at this office in the discretion of the supervising architect. JAS. A. WETMORE, Acting Supervising Architect.

LIABILITY OF AN EMPLOYER UNDER THE WORKMEN'S COMPENSATION LAW

By W. H. HORNER, *Director*

Bureau of Workmen's Compensation

The principle of workmen's compensation, which means that a person who is injured while at work shall receive payments during the time such person is unable to work, or that in a fatal case the widow and children, under sixteen years of age, or other dependents, shall receive payments during a certain period, and that the employer is required to furnish reasonable medical, surgical, and hospital services, medicines, and supplies for a given period; and pay a certain sum toward defraying funeral expenses, has been adopted by practically all the states in the Union. The only states that do not have compensation laws are South

Carolina, Florida, Mississippi and Arkansas.

The Workmen's Compensation Law in the Commonwealth of Pennsylvania was passed by the General Assembly in 1915 and went into effect on January 1, 1916. From that time to June 1, 1929, reports covering accidents to 2,396,917 persons who were injured in the course of their employment were received by the Bureau of Workmen's Compensation. Of this number 31,762 persons were either killed outright or died as the result of their injuries. Under the provisions of our compensation law during the same period, payments were made or authorized in 961,135 cases. The payments made or authorized in these cases amounted to \$157,399,375. These figures do not include the amount which was paid for medical surgical, and hospital services, medicines, and supplies, which would probably amount to at least one-third of the compensation cost. In addition to the compensation and medical costs, the wage loss due to these accidents amounted to millions of dollars. This brief statement will give a faint idea of the immense cost of accidents happening in the industries of our state.

The only classes of employees who are not entitled to the benefits of the compensation law are agricultural workers (farmers), domestic servants, and persons who are engaged to do certain work which is not in line with the regular business of the employer and which is known as casual employment. With these exceptions, every employer of labor in the Commonwealth of Pennsylvania is bound by the provisions of the Workmen's Compensation Law regardless of whether one person or one hundred persons are employed. In many of the states employers of three persons or less are not bound by the provisions of their compensation laws.

In this state when a person is injured in the course of employment the employer is required to pay compensation at the rate of sixty-five per cent. of the average weekly wage, but an injured person cannot receive more than fifteen dollars per week nor less than seven dollars per week. However, if the average weekly wage is less than seven dollars per week, the compensation rate shall be the same as the wage rate. Compensation payments do not begin until after the first seven days of disability. In addition to compensation payments the employer is required to furnish reasonable medical, surgical, and hospital services, medicines, and supplies covering the first thirty days after disability begins not to exceed the sum of \$100.00 for medical and surgical services, medicines and supplies. The law does not fix a limit to the amount which is to be paid for hospital services during the first thirty days of disability.

It may not be generally known that all

members of volunteer fire companies of the various cities, boroughs, incorporate towns, and townships shall be entitled to receive compensation in case of injuries received while actually engaged as firemen or while going to or returning from any fire, which the fire company of which they are members, shall have attended. The law makes it legal for any city, borough, or township of the Commonwealth to expend out of public funds of such municipality such amount as may be necessary to secure compensation insurance covering volunteer firemen. Since volunteer firemen are not paid for their services, their compensation rate, in case of accident, is based on the wage received in their regular occupation.

The Workmen's Compensation Law may be either accepted or rejected by an employer or an employee. In case either desires to reject the Act a specific agreement in writing between the employer and employee must be entered into at the time of hiring, and a copy of this agreement, properly certified, must be filed with the Bureau of Workmen's Compensation. When an employer rejects the Workmen's Compensation Law, he becomes liable for damages under common law and has practically no defense, if the accident can be proved. If an employer does not reject the Act he is bound by its provisions and has the privilege of insuring his liability for the payment of compensation in the State Workmen's Insurance Fund, in a stock, or mutual insurance company, or may apply to the Bureau of Workmen's Compensation for the privilege of carrying his own insurance. This privilege is only granted to employers who can satisfy the Bureau that they are strong enough financially to meet their obligations under the compensation law. Any employer who fails to carry compensation insurance or to secure from the Bureau the privilege of carrying his own insurance shall be guilty of a misdemeanor, and upon conviction

thereof for every such offense shall be sentenced to pay a fine of not less than one hundred dollars nor more than five hundred dollars and costs of prosecution, or imprisonment for a period of not more than six months or both at the discretion of the court. Every day's violation shall constitute a separate offense. The Department of Labor and Industry has decided that this provision of the law shall be vigorously enforced and that violators shall be prosecuted. In a number of cases in the City of Pittsburgh prosecutions have been brought and the violators have been held under bail for court. Similar prosecutions will be brought in other sections of the state.

It may be of interest to know that the Bureau of Workmen's Compensation has a record of every employer in the Commonwealth of Pennsylvania who is carrying compensation insurance or who has been granted the privilege of carrying his own insurance. With this information the Bureau can readily determine whether an employer is complying with the insurance provision of the Workmen's Compensation Law.

In this connection it is very important for employers to remember that minors between the ages of fourteen and sixteen years cannot be legally employed unless the minor has secured an employment certificate from the proper school authorities. Minors who are illegally employed are not entitled to compensation payments in case of accident, and the employer is liable to prosecution for failure to comply with the provisions of the labor laws. The employer may also be prosecuted for damages in the courts by the parents or guardians of the minors, and there have been a number of cases where heavy damages have been awarded against the employer.

The class of employers who usually are not complying with the Workmen's

Compensation Law are persons who employ only a few people. There have been numerous cases where compensation payments were ordered by a referee or by the Workmen's Compensation Board, but compensation could not be collected because the employer failed to carry compensation insurance and was not himself financially responsible. It is the intention of the Department of Labor and Industry to reduce this class of employers to the minimum.

The inspectors connected with the Bureau of Inspection and the adjusters for the Bureau of Workmen's Compensation have been instructed to be on the lookout for employers who are not carrying compensation insurance and report such violators promptly to the Bureau of Workmen's Compensation.

If you are an employer of labor and are not carrying workmen's compensation insurance, you should secure a policy immediately, covering your liability under the law. Play safe and secure without delay a compensation insurance policy covering your employes.

Compensation insurance rates can be secured from the State Workmen's Insurance Fund or any other insurance company authorized to write compensation insurance in this state by the State Insurance Department.

America stands supreme in the development and use of advertising, and advertising is the seed which by implanting desire produces the fruit of social advancement. Education promotes efficiency and efficiency in turn makes possible higher earning power, higher purchasing power and improved living conditions.

are practical, easy to construct, and architecturally distinctive and beautiful. Write or telephone Kalman Steel Company, Architectural Materials Dept., 1713 Sansom St., for information concerning Kalmantrim, Kalman Steel Buck and Kalman Steel Jamb.

BUILDING ACTIVITY INCREASES AS RESULT OF LOWER MONEY RATES

Already indications of a gradual increase in building activity as a result of the ease in money rates induced by the deflation of the stock market are being noted by members of the National Terra Cotta Society, according to William F. Lockhardt, Secretary-Director. The Society is represented by manufacturers in every part of the country, and is in a position to feel the pulsations of the national building market as it is affected by changing conditions.

"The offices of many of our members," said Mr. Lockhardt, "are now working at night on projects that are now alive after a period of lessened activity. Architects, too, we find, are busy getting out numerous plans for structural operations which have lain on the shelves because of unfavorable conditions.

"It has been amply demonstrated," he continued, "that the diversion of an abnormal portion of the nation's money from real estate into the stock market, with a consequent rise in interest rates, acts as a definite curb on structural operations. With the decline in security quotations, however, the cost of borrowing money has fallen rapidly and caused the prompt consideration of numerous projects that had been held in abeyance because of the financial stringency.

"It now seems probable, too, that money conditions will remain 'easy' for some time to come and that the building situation will likewise be definitely improved. Much of the money that was enticed from the real estate field by the glittering possibilities of common stocks, learned a graphic lesson in the recent debacle that will not soon be forgotten. With builders and realty able to obtain financing at a reasonable price, we can see an early and prolonged era of renewed structural activity."

BUILDING SPECIFICATIONS OF THE NEW YORK BUILDING CONGRESS

The preparation of standard specifications for the general construction trades has been under way by the New York Building Congress since 1925 and has culminated in the publication of 33 specifications approved by architects, engineers, trade associations, and other experts representing all of the elements of the construction industry.

The specifications describe approved methods of construction in accordance with present practices and conditions. They appear as the "New York Building Congress Standard Specifications, issue of May, 1929." The foreword by William Arthur Payne, chairman of the standards committee of the congress, states that they "are for the metropolitan district and have been written by an architect, and were carefully studied and indorsed by a committee of the New York chapter of the American Institute of Architects, and recommended by the chapter for use by the architectural profession. They have the written approval of the trade association where one exists in the industry, or by recognized experts, where there is no trade association. With this authority the specifications are issued as printed documents for the contract. By their general use the cost and uncertainties of estimating will be greatly reduced, and the causes of dispute lessened."

They have been given trials on representative building operations where their "clear, direct, and understandable wording" was commended. Although written expressly for the metropolitan district, they may find extended use, possibly with slight modifications, in all other localities in the United States.

The printed specifications are sold as separates numbered from 1 to 33 at very slight cost, and also as a bound volume, by the New York Building Congress, 101 Park Avenue, New York, N. Y.

The suggestion for the use of the standard specifications given by the building congress states:

"A standard specification to be of value must be designed so as to be applicable to every type of building. Obviously the extent of the work in any trade division will vary with the individual building. Requirements regarding qualities of materials and workmanship may, within certain limits, be standardized. A very logical division exists between extent of work, or work included, and the quality of materials and workmanship.

"The New York Building Congress suggests that specifications be divided into two parts, A and B—part A, specifying the extent of the work, to be written by the architect for each building; part B, describing quality of materials and

workmanship, standardized as herewith presented."

These suggestions are followed by a brief outline form for part A enumerating the various items to be covered by the architect. They further state that when the standard specifications are used in this manner they are to be found with part A of each division and issued as a complete document. They further suggest that where architects prefer to rewrite each specification they can still retain many of the advantages of a standard specification by copying the clause verbatim and so stating.

The 33 types of materials or work are covered by part B, all or any number of which may be used as required by the particular job. Each of these separate specifications includes paragraphs on "general conditions," "arbitration clause," and "scope." The succeeding paragraphs in each case depend upon the particular trade covered. For example, those covering "excavating" are "examination of site," "unit prices," "examination of drawings," and "equipment, etc." Specifications covering such items as "mass and reinforced concrete" or "structural steel" contain, of course, many more items. At a meeting held on May 21, 1929, in New York, these specifications were presented to a group of 50 prominent engineers, many of whom signified their intention of immediately making use of them.

A list of specifications thus far available follows: Demolition; Excavating; Waterproofing by Bituminous Membrane; Waterproofing by Plastic Coatings; Masonry and Concrete Materials; Masonry; Mass and Reinforced Concrete; Concrete Arches and Fireproofing; Structural Steel; Cement Finish; Furnishing Granite, Cut Stone, Marble, or Manufactured Stone; Furnishing Terra Cotta; Setting Terra Cotta; Vault Lights; Mail Chutes; Caulking; Metal Window Frames and Sash; Roofing and Sheet Metal Work; Carpentry; Architectural Iron; Architectural Bronze; Metal Furring and Lathing; Plastering; Interior Marble, Slate, and Structural Glass; Terrazzo and Mosaic; Tile (Ceramic); Hollow Metal Work; Metal Covered Wood; Glass and Glazing; Painting; Window and Door Screens; Weather Strips.

—*Architecture and Building.*

The importance of color in the home and office was stressed by the speakers at the Bankers' Industrial Exposition, the permanent exhibit of everything of interest to bankers and industrialists held November 6th, which was set aside on the Exposition's program as "Decorators' Day."

Among the speakers were G. H. Binder, Vice-President and General Manager of the Zenitherm Company, Frederick W. Bergmueller, President of the Ferro Studios, Inc., Miss Mary Ann Abel, color consultant of the Crane Co., and Charles Laurino of the Aeolian Company.

"Adam, in a strange environment, soon found that size, shape and particularly color made identity easier," Mr. Binder said. "There is no record of the fact but certain it is that, at the end of the first day, he was conscious of something strange and fearful when dark night obliterated the beauties of the day. Surely, he sought a cave or tree top when danger threatened and when security in this shelter, which we may call the first home, he soon set about making it comfortable. I think this was the beginning of interior decoration.

"The appeal of color is of early record. Noah, whether he knew it or not, must have had a good eye for color. He had to check up on all his passengers and each had to have 'atmosphere' to be contented in his 40-day apartment. At the end of the voyage, the record tells of the rainbow and we have been color conscious ever since, only more so recently.

"Peace, with its attendant prosperity and leisure, has always stimulated the expression of man's ideals in the finer arts. Each civilization has left its imprint in the fabrication of buildings or materials expressive of their feelings, inspirations and creative ingenuity.

"Nature supplied raw materials and man fashioned them according to his needs.

"We find ourselves today in an age where values are thoroughly appreciated, but urgency demands permanence and beauty with minimum cost. We no longer can be accused as a people, of taking our materialism straight. Our modern skyscrapers and automobiles—and even some factories—prove we are truly conscious of beauty as well as utility."

Color in bathrooms and lavatories is

now invading places of business, according to Miss Abel of the Crane Company. "Beauty and convenience in inner rooms can go hand in hand now, since the architect and builder have at their command modern designs for rest-room equipment to please the most discriminating," Miss Abel said. "Women have brought this color sense and its influence into business. The number of women employees, women in business on their own account and women conducting the business affairs for their families has increased from 10% to 40% in the past fifteen years. Builders and architects should consider this increasing number of women in business and should see to it that adequate facility for their comfort is one of the absolute requirements in office building construction.

"The banking business especially has felt the influence of the growing number of women patrons and is not slow to see the necessity of providing them with comfort and beauty,—things which a woman senses and keenly appreciates. To give an impression of homelikeness and harmony in such rooms is the modern equivalent for old-fashioned hospitality. Not the least among other reasons for doing this is that of owner-pride and a fitness of things. The physical surroundings in which one does business produce a lasting impression."

The Decorative Uses of Wrought Iron were explained by Mr. Bergmueller, President of the Ferro Studios, Inc. All of us have in our homes one or more articles made of wrought iron in which we take particular pride, whether it be a foot scraper or an elaborately wrought stair railing, according to Mr. Bergmueller. Wrought iron is particularly adapted to bank interiors, Mr. Bergmueller concluded, for it is symbolic of strength, dignity and honesty.

BEAUTIFUL DOORS ADD TO VALUE

Beautiful doors, doors that are structurally good, add a great deal to the value of a residence. They may be in large measure a deciding factor determining whether a home offers charm or intangible disappointment. Doors are the gateways to your home and its rooms; they should be of good materials and well made. Good doors add greatly to the comfort of living in a house.

A stock door produced by a manufacturer who has been making doors for three generations has as one of its distinctive features a recessed panel together with a stock molding in a stock thickness of doors.

It was the first stock door to have this feature. It combines the simplicity of the single panel with the richness of the moulded door. It has a character that lends itself to the many architectural styles due to its artistic lines and proportions.

This door is strongly made and structurally correct. It is made in both hard and soft woods. Patented standards of precision in wood manufacture, combined with quantity production have made this door possible at a reasonable price.

We are likely to think of a door as merely a door, simply a necessity, and as such dismiss it from our thoughts, but this is a mistake. Doors are one of the few moving parts of the house and one of the most conspicuous pieces of the interior equipment. They must function properly and fit snugly; nothing is more irritating than a door that refuses to open and close easily, or one which has poor lock action.

The close grained woods of which the doors referred to are made suits them for paint, enamel or lacquer. They accept any color treatment that is desired and retain their beauty. The wood will not open up under the influence of heat and cause the finish to crack.

Recently a new line of doors with

white pine stiles and rails and figured white maple panels was announced. Large production of veneers and the economies of mass production, it is claimed, bring a product that would ordinarily be too costly for the small builder within his reach. Special care is taken to select panels for their beauty of figure.

Mirror doors offer a pleasant means by which the apparent size of a room may be increased and are an accessory of genuine usefulness in the bedroom or bathroom. They fit in particularly well with the one-panel type of door which is frequently uniformly used throughout the house in location which do not require the mirror door.

If two adjacent closets are equipped with mirror doors and the intervening wall space filled with a mirror, a triple arrangement will be secured in which any series of reflections desired may be obtained. To secure this arrangement both doors must be hinged so that the swing is toward the mirror. Such an arrangement is particularly convenient in bedroom or dressing room.

—*East Bay Builder.*

SCIENTIFIC RESEARCH ON BRICKLAYING AT MELLON INSTITUTE

An interesting example of collaboration between scientist and artisan is found in the broad scientific study of bricklaying recently inaugurated by Mellon Institute of Industrial Research and the Eastern Face Brick Manufacturers' Association. The experiments are being carried out by Dr. F. O. Anderegg, Senior Industrial Fellow of the Institute's Multiple Industrial Fellowship on Portland Cement, and his assistants; architects, building contractors, and masons are aiding the work by contributing opinions and advice based upon experience.

So many varying factors are involved in the construction of a brick wall that it has been necessary to limit the experimental study to combinations of variables representing the probable range of prac-

tical application. Hundreds of thousands of experiments would be required if all possible combinations were to be studied. For this reason the research program has been under discussion for a considerable period of time, and the recent investigation was begun only when a satisfactory plan had been elaborated. Up to the present time some 300 experimental walls or panels have been erected on the grounds of Mellon Institute Building No. 2; a supplementary series will be constructed during the winter.

In brief, the investigation will cover certain aspects of all the factors involved in bricklaying. The most obvious points of attack are studies of the characteristics of different kinds of brick and mortar. Problems of special appeal to the practical man are those concerned with different methods of backing and with differences in workmanship. The design of walls and their relative elasticity are subjects which will be of considerable interest to contractors and architects.

Brick and mortar problems under investigation include the absorption and surface characteristics of brick, and differences in mortars due to varying the cementing materials, sand, and pigments. Properties of the mortars which are being studied carefully are workability, compressive and transverse strength, absorption and permeability, shrinkage, durability, staining and efflorescence, and elasticity. Information is being collected to determine whether the 10 per cent. of lime often specified by architects or the 25 per cent. or more usually employed by brick masons gives better all-around results.

The problems in backing include a study of hollow tile of different sizes, of brick, of cinder or concrete block, of brick tile, and of metal or other lath on steel frame. Variations in workmanship are most apparent in regard to tapping, pointing, and the filling of head-joints. The first mentioned subject is being studied, not only in regard to the effect of excessive downward tapping into place, but also in regard to plumbing both before and after initial set.

Among the most important problems of design are the nature of the backing unit and the method of connecting the face and backing. Coping and parapet construction are likewise being investigated. Capillary contact with the ground and condensation allow moisture to penetrate into the wall and must be guarded against. Finally, a study of special interest in this day of high buildings is the elasticity of walls of different types.

Special mention should be made of weather problems. The experiments have been planned for the purpose of investigating the behavior of mortar with reference to the other variables in all types of climatic conditions.

The whole study provides an addition-

al instance of the manner in which scientific methods are adapted to every day problems. Scientist and engineer, business man, architect, skilled workman, and laborer are all working together for the improvement of living and economic conditions of the world.

All results of this investigation will be published for the benefit of every one interested in building construction.—*Architecture and Building*.

SAVING AND INVESTING

Investments, generally speaking, are made usually with the definite hope of an appreciation in value of whatever one buys and an expectation of being able eventually to sell at a profit, meantime realizing a fair return upon one's money. Too many of them fail to live up to such expectations.

Saving is that interesting experience entailing sacrifice and more or less penny-pinching and skimping which is necessary with most folk before they can step into the investment class. Incidentally it requires considerably more determination and stick-to-itiveness than does investing.

And the road is longer and harder.

The vista of thrift stretches out immeasurably and endlessly, but the terminus may be very suddenly and disastrously reached in investment. One can always save; the better when he has the least. But he finds it increasingly difficult to invest as his capital dwindles.

The money one puts into a brick home is not only saved, but usually is well and safely invested. Ordinarily the brick house, well located, increases in value as the years go by and the city expands. There is comparatively little depreciation during the first twenty-five years, and by that time most people are ready to sell and build another house. Meantime they have enjoyed a fine return on their money.

It is the high resale value of the brick home that in the end always is most gratifying. No other type of home equals the brick house in this respect.

—*Building Economy*.

HELP THE FIREMEN RESCUE THE DOLLARS

Dollars have a strange and persistent way of disappearing. You may have a fortune today and lose it next week, or next month, or next year. It may slip away from you by degrees, by the decrease in value of your investments, or from careless handling or indifferent and extravagant habits of your own.

But always the dollars will survive although you may have lost them. Someone else gets them or has them. They remain in existence, and one day or another you may win them back.

It isn't so with the dollar that goes up in smoke in a residence, a business block or industrial fire.

Those dollars simply die. They are never restored. They may be replaced in part by the insurance companies but the original investment is wiped out forever.

All that remains to show for those dollars is an ash heap.

No other factor in our economic life causes so great a leakage of intrinsic worth as does fire. Nothing is so destructive of value. Nothing kills more dollars.

Yet people continue to take chances with conflagration. They build of inflammable materials to save a few dollars at the outset only, too often, to lose tremendously in the end. Nothing could be more shortsighted.

Firesafe masonry construction, generally adopted, would save America untold millions of dollars annually. Brick does not burn. It is the greatest and most effectual deterrent of communicated fires.

Even where fire attacks the building with walls of brick there is always a very large proportion of salvage regardless of how great the destruction. Fire never burns up the dollars invested in brick.

These facts are all too frequently overlooked in the propaganda the fire preventioners put out during these Fire Prevention Weeks. Their arguments would be far more effective in the long run were they to urge building against fire instead of urging greater care after an inflammable structure has been built.

It is fine to be careful.

It is better to be foresighted.

The place to begin fire prevention effort is at the architect's drafting board.

Firesafe buildings are the best prevention against fire. And brick construction is the answer.

—*Building Economy*.

BOTH SIDES OF PAINT COSTS

Prospective builders should be interested in the recent statement of H. L. Wilkinson, treasurer of the American Paint & Varnish Manufacturers' Association, to the effect that the country's annual painting bill amounts to \$600,000,000 while the loss from failure to paint aggregates close to a billion dollars more. Much of this loss and cost falls upon the home owners of the United States.

Wilkinson was quoted as saying, "The depreciation because of lack of paint was set by bankers, grange officials and county agents at from 7.2 to 10.8 per cent. Using the lowest figures the annual loss on an investment of \$11,486,439,543 gives \$830,400,000. This alone would far more than pay for having the buildings painted every year."

It would be interesting to know just how much of that paint bill, and how much of that loss from its lack, applies to the homes of America. Wilkinson did not say, if in fact he knew.

But regardless of what the amount may have been it was far and away too much.

When common brick homes may be built, as they can be built today in most sections, at a cost not exceeding 5 per cent more than that of the frame home and frequently quite as cheap, there is no excuse for any man burdening himself with their excessive additional cost for painting.

Brick homes do not require painting save on the exposed woodwork about windows, doors and eaves. It is a very small amount at most. Negligible in fact.

The easiest way to save the surface is to build the wall of brick. It is far the most economical in the course of a decade. And the longer it goes the greater the dividends.

—*Building Economy*.

The 1929 meeting of the American Construction Council will be held December 12th, 13th, and 14th at the Sherman Hotel, Chicago, Illinois.

The general theme of this meeting will be: "How to Maintain Prosperity through Maintaining a High Level of Construction Activities."

This meeting will be held largely in the form of round table discussions on practical ways and means of encouraging construction. There will be, of course, speakers of national prominence as well as banquet and luncheon meetings.

Because of recent speculative developments in the securities market and business at large, the Council's Board of Governors last week authorized a statement to the public to stimulate the right kind of building investments.

A technical bulletin describing the "battledock floor" construction has just been issued by the American Institute of Steel Construction. This is a floor made of steel plates welded to I-beams. Appended to the description are allowable load tables figured for both web shear or flexure, whichever is least.

Some few experimental floors of this type have been installed during the past year. Special automatic welders have been designed to handle the work and a demonstration of the proper method of construction was staged at the Seventh Annual Convention of the Institute at Biloxi, Miss., on November 14. Complete engineering data on the floor is provided for the first time in the bulletin just issued.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. A carload of details can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

Fire and Marine
Insurance
Company"*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

PHILADELPHIA

and the

write practically every form of Insurance, except life*

**"ANTI-HYDRO" Waterproofed this Basement—
50 Feet Deep—in Water Soaked Ground**

Waterproofing the concrete work below grade in this building presented a most difficult job. Water was encountered 8 feet below grade. The bottom of the boiler room extends 50 feet below the curb. Huge pumps with a capacity of 450 gallons per minute were required to keep the excavation dry.

All concrete work below grade is permanently waterproofed with "ANTI-HYDRO" and guaranteed for 5 years, backed by a \$5,000 surety bond. The basement floor slab is 30" thick and heavily reinforced to withstand a 42-foot head of water. "ANTI-HYDRO" used throughout the mass keeps it absolutely dry!

No matter how large or small your concrete job may be—you need "ANTI-HYDRO". It permanently hardens and waterproofs concrete in one operation. Easy to use, too. Being a liquid, it mixes readily with the gauging water without the aid of skilled labor.

Twenty-five years of continuous use prove the merits of "ANTI-HYDRO". Once you use it, you will never pour concrete without it. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., November 23, 1929.—Sealed Bids will be opened in this office at 3 p. m., January 6, 1930, for the demolition of old and the construction (except elevators) of new six story, basement and sub-basement stone faced, fire-proof, U. S. post office building, approximately 233 feet by 278 feet ground area, at Baltimore, Md. Drawing and specifications, not exceeding six sets, may be obtained at this office in the discretion of the supervising architect by any satisfactory general contractor, and provided a deposit is made of \$50. for each set to assure its prompt return. Checks offered as deposits must be made payable to the order of the Treasurer of the United States. JAS. A. WETMORE, Acting Supervising Architect.

RATIONALIZING OUTPUT

By CHARLES F. ABBOTT

Executive Director, American Institute of Steel Construction, Inc.

Despite the progress made in management during the past few years, there are certain economic factors today which are confessedly disquieting. I refer in particular to the oft-claimed possibility that, by reason of the improvement of mass production, output may outstrip consumption. Seemingly that has at times happened, markets have been glutted with goods and the crisis passed temporarily merely by a judicious cutting of prices. Many of our business executives have been led to believe, because of this recurring phenomena, that there is a potential excess plant capacity constantly existing within their industries.

So long as we look at this problem from the point of view of the manufacturer we will forever be confronted with the spectra of market satiation and excess plant capacity. That, of course, is disquieting and justly caused considerable worry in the business world. If we are to remedy this situation, we must divert our planning from the problems of production and give some thought to the problems of market and the distribution of the goods we are manufacturing.

We are at a stage of industrial development where it is much easier to produce than it is to sell that which we produce; it is easier to employ scientific management in the factory and eliminate production waste than it is to make a profit on our goods. Efficiency in plant production has reduced costs to the minimum, and therefore if relief is to be expected from the many perplexing problems it must come from similar attention devoted to the market and distribution methods.

The principal problem confronting most industries at the present time is that of the market. Consumption must be maintained on a basis equaling capacities to produce or production must be stabilized in keeping with ability to sell. There are instances where demand is declining or where it is impossible to increase it to any extent, and, under such conditions, diversified production or the development of new uses would offer the solution.

The textile industry diversified its production by producing rayon, while the iceman began to sell refrigerators, butter, eggs and cream, as electric refrigerators encroached upon his market. The coal man is soliciting orders for oil, and there are many other instances where diversification has been necessary to meet changing economic conditions.

In most cases, however, the application of research by an organized industry would undoubtedly develop new practical uses for the product and at the same time locate new opportunities for extending present markets. Steel plate floor construction, the use of steel in dams, in airports and hangars and in residences, all represent the result of concerted research

to locate and develop new uses for the structural steel industry.

When we suggest research for an industry we should not expect immediate results. It is no assured talisman, for results will depend upon how research is conducted. In order that it may be productive of good for the industry as a whole, it must be carried on by the industry, and not left to a single company. In that case the industry will profit through impartial investigation, while, when in the hands of a single corporation, the benefits must of necessity be selfishly applied and selfishly circumscribed. Research by joint action of an industry as a whole may reasonably be expected to promote the best interests of all—the industry as well as the public—and not that of a single company.

It is too bad that some money-making and money-saving methods are called "research." The word calls up visions of high-brow investigations by expensive experts. "Research" has a scientific sound. An ordinary business man is scared by it; in fact, he may think trade research is "theoretical" and academic. He turns impatiently from it to his rule of thumb practices—which sometimes lead him to the bankruptcy courts.

Research improperly applied may prove as great an industrial waste as any agency for waste business has ever experienced. Dr. Julius Klein, Assistant Secretary of Commerce, holds that between eight and ten billion dollars annually is chargeable to waste in the conduct of business in America. This waste about equalled the value of all our foreign trade in 1928. Waste occurs through excessive expendi-

tures in sales promotion, unwise credit methods, disorderly marketing, extravagant delivery services, ill-judged advertising, etc.

Inability of business executives fully to appreciate the problems of distribution, to have any known yard-stick whereby to measure market possibilities, lacking any scientific approach to the control of marketing costs, constitutes the basis of this present-day problem. The Federal Government has authorized the taking of a census of distribution. It will be the first time any real concerted action has been taken to measure the volume of our own domestic consumption. Without that measure we will continue to ship our goods to a market about which we have no exact knowledge.

Until now we have imagined that if goods refused to sell it was due to the fact that the price was too high, and our more powerful corporations would set about finding new means of reducing production costs. Since 1920 millions of dollars have been expended in modernizing the steel plants of the United States, reducing costs of production. But all those huge savings have been passed on to the public in the way of lower prices. All the potential profits have been dissipated by inefficient selling due to our inability to rationalize output.

We know for a certainty that our structural steel consumption might have been increased tremendously. As a matter of fact, it has been increased nearly three times in volume since the World War. It is possible today to increase it fifty per cent. more by properly promoting the markets which we know are possible. This would require greater concert in selling methods and a more scientific approach to the market problems, however.

Similarly, relief could undoubtedly be found for the other branches of the steel industry if proper attention were devoted to the exploitation of present markets, combined with the application of research to promote new uses.

One hears a good deal about the saturation point, where demand, like a loaded sponge, refuses to absorb further. But repeatedly the country has reached and passed what timid prophets thought was its utmost need for a given commodity.

To accomplish such a result it is essential for industry to recognize the vital need of co-operative advertising to the public in order to reinforce the activities of individual efforts. Advertising in the past has too frequently been considered either an item of expense or a contribution to editors to sustain cordial relations.

The idea of advertising as an investment from which very definite returns might be expected is not generally accepted by all in the steel industry. There has been some commendable effort where advertising campaigns by individual companies have been intelligently conceived

and executed, but in nearly all instances they have been confined to trade advertising rather than to the public. The public have a definite influence when it comes to the use of steel or any other materials. In the last analysis the public decide whether steel or some other materials will be used. Their influence and approval in the development and exploitation of markets is of outstanding importance. To disregard public opinion is to neglect the only influence that can make possible increased consumption. In these days of economic changes advertising is recognized as the principal power to be utilized in solving disturbing problems.

I am not alone in holding to this conviction. It has been estimated that advertising appropriations during 1929 exceed by 20 per cent. those of 1928. That would seem to prove conclusively that most business men consider advertising important. It is important just to preserve the present market of an industry, for without adequate advertising substitute materials would soon nibble away at the market an industry justly occupies.

Today the steel industry is confronted by competition from the producers of copper, aluminum and other substitute products. Only because manufacturers outside the steel industry and on their own initiative have constantly been discovering new uses for steel has it been possible for the steel producers to continue enjoying an expanding market, yet blind to their full opportunities. That is why we find today some who still refuse to believe that the advertising of steel would either prove practicable or that it is necessary. This belief is inspired by production minds, minds which are ignorant of the benefits of rationalized output.

In the past there has been little need for the exercise of selling effort, for the only problem was to produce the steel to meet voluntary demand. But today we are beginning to see changed conditions, where demand must be stimulated if production schedules are to be maintained. The reason we hear so much about excess plant capacity is due to the fact we have neglected to apply a scientific study to our market problems.

To permit continued excess plant capacities through failure to develop markets forces a scramble for business at cost, or less than cost, to fill existing plants. Not infrequently business is taken merely to keep plants running. Increased consumption and the development of new uses would remove the excess plant evil. As consumption increases, prices and profits should advance and prosperity become a realization.

Mass production is predicated upon constant production, and it is expensive if the operation is halted or stopped. Under such a system it not infrequently happens that 50 per cent. of the cost of an article is due to plant stoppage, for that

cost continues no matter whether the plant is in operation or not. That is why a plant is often encouraged to sell its output at a loss. It is that much more reason why we should take steps to cut those losses before they start, to appraise most carefully the absorptive capacity of the market for the article produced. If the planning is done correctly we can avoid the loss and insure the plant of continuous operation when keyed to meet the demand and not to exceed it.

There are some companies still left which insist upon taking larger orders before it is realized that they are worth about as much as zero with the rim ripped off. It is difficult for such a management to admit that a million times nothing is still nothing. But with them the weeks will accumulate into months, and the months into years, while they are trying to find the profit from jobs sold at cost. If we are going to continue to put steel in great skyscrapers or bridges and pay for the privilege of doing so, then why would it not be better to go into the peanut business, where we could get some real money for the peanuts we raised. The big distributors of cigarettes are today trying to find their profits in the sale of sandwiches. Their distress should give many of us food for thought.

If we are going to reduce the level of selling steel to a mere bidding at auction for every job that comes on the market, then we must measure success by those who buy the greatest number of concessions and to whom we sell what we have bought.

The price cutter of today writes the whole story on the price tag of tomorrow. The individual who insists upon price cutting as a means of obtaining his business is worse than a criminal. He is a fool. He not only pulls down the standing of his company,—he not only pulls down his competitors,—he pulls down himself and his whole industry. He scuttles the ship on which he himself is afloat.

It is easy to cut a price, but it is difficult to reconstruct the price structure after it has once been pulled down. The constant lowering of prices is an endless process; it lowers us into a hole, the bottom of which has never been reached. The price cutter may be low today, but his competitor will see to it that he is not low enough tomorrow. In this downward trend of prices there comes a time when the selling prices are below the cost of production, profits are dissipated and business is being transacted at a loss. In this wild scramble for volume, industry must learn that distress lurks just ahead, and the only remedy lies in the rationalizing of output.

The large corporation, because of its supposedly vaster resources, cannot expect to win at such a game. Whenever

the selling structure is lowered so that it focuses attention upon nothing but price, the large corporation is at a serious disadvantage, because the small company has the ability to maintain personal contact with customers, which is the balance of power often swinging the contract. That intimate contact, offering a specialized service, which a small concern holds out to customers, is a very tangible advantage held over the big, unwieldy corporation.

If pressure is constantly applied to maintain consumption in line with production, then most of our difficulties might disappear. That is, of course, assuming we could check the desires of the ambitious producers from adding unduly to their plant capacities. There are, however, those who are obsessed with the idea that they are privileged and that they alone are entitled to keep growing.

Congress has authorized a census of distribution. Unconsciously that gives official sanction to a new science, the science of rationing output to consumption. We have been awakened to the necessity of putting a curb on selfishness and of ridding industry generally of the tremendous wastes in marketing produce. The day is rapidly approaching when we have every reason to expect to have a rationalization of output to consumption. We are only beginning to discover means of measuring the volume of the market potentiality. We have yet to develop that method of regulating production to consumption capacity. When we reach that point we will have devised a scientific rationalizing of output.

Industry exists to serve mankind. Only insofar as it is successful in serving mankind will it make a profit for the persons who run it. But there is no service to mankind in flooding the market with duplications of goods which can never be consumed profitably. We not only depress the profits of the producers, but

also depress the value of that part of the production which has already been passed on to consumers and which consumers hold in their capital investments.

Over-production not only invites bankruptcy for the industry over-producing, but also encourages bankruptcy among those who consume the output of that industry. And bankruptcy is one of the greatest industrial wastes that we have to contend with today.

Modern statesmanship must take this fact into consideration. In preaching the merits of rationalized output, we are but preaching a better industrial life, we are merely encouraging some kind of a uniformity of success and pointing the way to the removal of waste.

We have the merits of cost accounting hurled at us from time to time. There is a good deal of truth in the claim that producers should know their costs if they would do business on a successful basis. That is axiomatic, but it goes only half the way—knowing our costs is but the first step. The second is to know our market. But even assuming that we know both, it is of little avail unless we act upon the information that has been given us. We must rationalize the output. We must equal production with consumption, and thereby do away with periodic slumps, unemployment and reduced buying power.

Stabilized production would do more to improve prices and profits, to eliminate destructive forms of competition than any other influence that can be brought to bear. It is the key to greater prosperity, and the market is the direct approach through which research, advertising and educational promotional effort would complete the answer.

No industry, however, has a right to assume a necessity for rationing output until it is definitely determined that it has satiated its market. For instance, it has been claimed that the automobile manu-

facturers consume ninety-five per cent. of the drop forgings made in this country. Does this measure the extent of that market? Is it not possible for the drop forging industry to find an even broader market? That, of course, we do not know until the forging people themselves have made a better analysis of their possibilities, and taken their census of potential as well as actual distribution.

It is not infrequently the case that the small companies in an industry are more alert at discovering new outlets for their product than are the big, unwieldy corporations. We speak of research in a rather general way. But research may be just as successful in the market-place as in the laboratory. Often the opportunities of research are laying beneath our noses unnoticed, and that is what makes business opportunities so plentiful, and why it is always unwise to depreciate the efforts of even the smallest competitor. In co-operative effort we profit by bearing each other's burdens as well as in sharing each other's benefits.

The opportunities for one company to help another, for co-operation between so-called competitive units, are legion. The truth of that may be easily recognized in the matter of developing new markets, but it is equally true in this more important endeavor to rationalize output. Co-operation in industry, as it is being effected today under the supervision of the Federal Government, does not mean price maintenance. We are forbidden to advise competitors on selling prices, but, on the other hand, we might feasibly advise each other as to expansion of productive capacity. There is where co-operation can be effectual and economically advantageous to the whole country.

Excess and idle capacity represents a loss of time and energy involved in its creation. The public which buys the output of the active portion of an industry are compelled to pay the carrying charges for the idle portion. The system is economically unsound.

It is, of course, only by an adjustment of supply to demand that prices can be stabilized or maintained at a profitable level under a system of competition. Oil producers recognize this. Indeed, it is the inspiration of the effort now being made to bring about a better control of oil output.

It is certainly the part of wisdom in this country to have our resources of oil, copper or other basic commodity judiciously used, rather than to make them very cheap at one moment with widespread waste, and their application to uses for which some other material would be preferable.

Steel is a most important material to progress and the advancement of civilization. The world's potential supply of

iron ore is not inexhaustible. Experts have ventured to estimate when these ore supplies will be exhausted. It would seem, therefore, that the conservation of our iron ore deposits would be a problem worthy of consideration, and, in the meantime, iron and steel products should command prices more in keeping with their intrinsic values. Otherwise our immediate profits are unreal, as they make no provision for the future.

Every business enterprise is a public service undertaking. It can make good and should be allowed to exist, only about in proportion as it recognizes the public character of the function it is performing. One of these functions is that of treating its customers alike, relieving them of the necessity of bargaining, and thus allowing them to exert their full economic strength in other and more economical directions. Every business unit owes it as a duty to the public to observe an uniformity of prices and an uniformity of treatment of customers. When there is need for a change in prices or a change in production schedules, that change should be made upon an uniform basis, giving full publicity to the reasons which prompt such change.

It is the duty of business to preserve its economic freedom by cleaning up archaic practices instead of waiting for an aroused public opinion to call upon the Government for drastic regulation. Failure to obey the warning threatens us with State socialism, for when the consuming public is conscious of the fact that private business operates in a wasteful way, it will demand public control of business. A rationalization of output therefore is not advocated solely for the benefit of private ownership, but only after a mature consideration of our solemn responsibilities.

At this moment we know that the Government is willing to assist us to achieve these reasonable endeavors. If the Government is willing to assist in the elimination of unfair methods of competition, then why should a small minority of business men oppose the constructive assistance that the Government is willing to extend?

We cannot expect industrial prosperity unless all industry is prosperous. Society, with labor included, is advanced when industry prospers, and both suffer when operations continue without a reasonable profit. Destructive methods that are prevalent in many industries dissipate the profits as price-cutting and selfishness place business at any price ahead of all other motives.

Codes of Selling Practice, as encouraged by the Federal Trade Commission, will go a long way toward removing the destructive, unfair methods, and thereby create better competitive relations. The only objection that can be offered in opposition to the adoption of a Code of

Selling Practice is a desire to continue the destructive measures as already operative. If left to individual action, the spirit of selfishness cannot be controlled, jealousies and suspicions will continue and methods go from bad to worse. The only practical solution is to place all reliance upon organized co-operative action supported by the wholesome influence of the Federal Government.

There is very good reason why some 13,000 trade associations have come into existence in this country. We are forced to admit that there is merit in co-operative activities. The good that has resulted is the merest beginning. Once realizing that this good may be shared with the public in general as well as by the individual units of an industry, we may confidently expect co-operative efforts to advance rapidly and with Government sanction. If we are to attain any measure of rationalized output, it will be through these co-operative agencies.

WINTER WINDOWS NEED WEATHERSTRIPPING

By JOHN WORTH

As cold weather once more comes on, the need for well weatherstripped windows becomes more apparent, and while this work should no doubt have been done much earlier in the season, it may not yet be too late to obtain business of this kind with the proper arguments.

It may be well to list briefly right at the start the major argument used to show the value of proper weatherstripping. Some of the important ones include:

1. Engineering tests have shown that twenty to forty per cent., depending on varying conditions, of the heating expense of a home can be saved by weatherstripping doors and windows.

2. Weatherstripping keeps out cold drafts, dust, soot, rain and snow. It is a valuable feature to the housewife, who is more able to keep the home clean and prevent dirtying of curtains, drapes, and wall coverings.

3. It keeps the heat in as well as the cold out.

4. Weatherstripping makes windows slide easily even while weather-tight. No matter how efficient a builder may be, it is difficult to leave a window that is weather-tight loose enough for easy operation.

5. Weatherstripping stops the rattling of windows, which is an important feature. It also helps deaden noises occurring outside.

These are some of the chief arguments for weatherstripping, but standing far ahead of all the rest is the matter of heat loss. A little mathematics may be employed to prove this fact. Cracks between the frames and sashes of double-hung wood windows may vary in width from 1/64 to 1/4 inch. For the sake of this example, let us take 1/16 inch as an average.

Multiplying 1/16 inch by 216 inches, the distance around an average window, gives 13 1/2 square inches. That is, the cracks around a window are equivalent to a hole 13 1/2 inches square. It is obvious that this means a large heat loss.

Another startling example of the heat losses in an ordinary room due to leaky windows can be shown through consideration of the living room.

Effect of Various Winds

Tests of the American Society of Heating and Ventilating Engineers show that with an assumed wind velocity of five miles an hour, a wind that is hardly noticeable, there will blow into this room through the north windows alone, in one hour, almost enough air at zero temperature to fill the room entirely. At least 15

square feet of radiation will be necessary to heat this air to 70 degrees.

With a 10-mile wind the infiltration will be 6,535 cubic feet, and 35 square feet of radiation will be needed. Increasing the wind velocity to 20 miles an hour brings the infiltration to almost four times the volume of the air and the radiation to 61 square feet.

If we consider a 30-mile wind—no stranger during the bitter cold of December and January—the leakage through this one window will change the air in the living room every 11 minutes. Under these conditions heat would have to flow continuously from a huge radiator—100 square feet—to heat the incoming air, and coal would have to be burned at the rate of 3 pounds per hour, or nearly 75 pounds per day.

In the poorly-built home there is a constant drafty circulation of air that keeps expensive heat flowing from the house.

A wind blowing on the north side of the house causes an inflow of cold air, which is accompanied at the same time by an outflow from windows on the opposite side of the house. It can be very well shown that if three sides of the room are well weatherstripped, leakage on the fourth side will be negligible.

The modern types of weatherstrips, whether made of zinc, bronze, brass, copper or similar metals, usually work on either one of two principles. The first is the contact or spring principle, typified by spring bronze strips, and the second is the tongue-in-groove.

One reason why practically all windows need weatherstripping, especially when made of wood, is that absorption of moisture causes warping, swelling and shrinking. The properly installed weatherstripping will protect this area left by the warping of the window.

The fact that weatherstripping can easily pay for itself may be determined by simple computation. According to the figures of the American Society of Heating and Ventilating Engineers, wind velocity in New York and vicinity during the three months of December, January and February is 13.3 miles. At this velocity the square feet of radiation required to take care of the loss due to infiltration through one linear foot of crack is 0.65. If the window were weatherstripped, the corresponding radiation requirements would be .12 square feet, showing a saving of .63 square feet of radiation.

Saving Is Almost Enough to Pay Cost

A fair estimate of cost for a heating system would be \$2.00 per square feet of installed radiation and the saving effected through weatherstripping can safely be taken as one-half of this, or \$1.00. As the weatherstrip probably could be put on for less than 50 cents a foot, there is no question that the installation is good business.

On the basis of yearly saving, if a 5,300 degree-day heating load is used, we will find a requirement of about 70 pounds of coal per square foot of radiation per heating season. At \$16 per ton,

the annual saving due to weatherstripping will be about 30 cents, or almost enough to pay for it.

It must be remembered that the best types of weatherstripping, if carelessly applied, may fall short of providing the immunity from heat loss claimed. Good weatherstripping well installed should last as long as the house in which it is placed. The technique of application, however, is of as great importance as the excellence of design or quality of material.

Inside Pressures

An interesting fact is brought out in connection with heat losses by Professor Emswiler, of the University of Michigan, who made a study of this subject. He points out that even without any wind, a difference of temperature inside and outside will cause loss. This is because the pressure inside is less than that outside at the ground and greater near the roof, so that inflow will occur at lower windows and outflow at upper windows. If the building is small and open throughout from bottom to top this difference in pressure may result in greater movement of air.

A wide variety of weatherstripping materials are available on the market and they offer suitable equipment for windows and doors. The tendency to make use of these products is greatly on the increase, due to the fact that these tests have so clearly demonstrated the actual money value of the installation. It is entirely possible in the construction of a small house, to spend \$500 for insulation and weatherstripping and save \$300 to \$400 right at the start in the cost of the heating plant. In addition to this, the well weatherstripped house is more comfortable in both summer and winter, and is thus a better investment for anyone.

Many builders who very thoroughly equip and build their house, including valuable modern features, neglect to make proper use of these features in their selling arguments. This is true in the case of weatherstripping. The casual observers will completely pass by the values here

Directory of the Architectural and Building Trades of Philadelphia

WILL SOON GO TO PRESS

To be sure you are correctly listed with Address, Bell and Keystone Phone numbers, advise us of any change contemplated.

This Directory will be in the hands of the Architectural and Building Trades early in 1930.

If you have any product, material or services you sell to the Architectural and Building Trades of Philadelphia, an advertisement in this invaluable daily reference book will keep you constantly before prospective purchasers of your services and products.

provided if they are not called to their attention.

A Sales Asset

A number of plans have been developed and tried by various home builders. Placards on the outside may announce the fact, and such advertising may usually be obtained free from manufacturers.

One of the best methods is the use of neat, well-printed cards inside the house when it is on display, or awaiting sale. These cards are lightly pinned to the wall or woodwork near the window and connected by colored string or ribbon to the point nearest the weatherstripping. They call attention to this special equipment.—*Building Age*.

COLONIAL HOUSE GIVES CHARM

Not alone did the Pilgrims lay the foundation for American civilization by leaving behind them a trend for truth, zeal, and sturdiness that have been the sinews of this country, but they have given to the aesthetic home lover, ascetic though they were, through their quaint American style of furnishing, a joy that can be derived from no other mode.

For there is a certain charm in the Colonial style that no other furnishings achieve. Perhaps it is the simplicity, perhaps it is the lovely woods, perhaps it is the eventful past it signifies and which is so close to American hearts. It calls to mind persevering Pilgrim fathers; trim, precise Colonial dames, and hoop-skirted, dainty misses.

It is a cleverly modern home that borrows its furnishings from the past and captures old-time charm, and no scheme does this more completely than the early American. For there is an atmosphere about Colonial rooms that is as suggestive as a whiff of lavender, and quaint as the times

they represent, yet made comfortable with modern workmanship while closely following the finest and truest of Colonial designs.

In each home there should be at least one room furnished in the early American spirit; for there is a subtle suggestion of peace, rest and friendliness accompanying the charm of such furnishings. And while these are characteristics that each room should possess, perhaps the bedroom more than any of the others. The dainty four-poster bed, the powder table that fairly invites vanity, gay hooked rugs and frilly, flowery curtains, together with chests and high-boys, make a room of simple, lovely contentment.

And except to him who demands the real antique, Colonial furniture has comfort as well as charm. The early Pilgrims not only landed on a stern and rock-bound coast, but they made their furniture that way as well. They were also content to sit on Sunday in hard wooden, straight-backed pews in church.

And to carry out the ensemble of the Colonial room, machine-made hooked rugs and carpets are available in quaint patterns if one does not care to invest in the original hand-made ones. And there are pewter lamps, and table and floor lamps in quaint design, true in style except that they are wired for electricity in place of the original wick and oil. Such things allow one to carry out the Colonial atmosphere in the room to the best detail.—*East Bay Builder*.

PERMANENT CONSTRUCTION

Every year the incentive for more permanent construction increases. It is far greater today than it was twenty-five years ago. It will be even greater in another decade. Every development, every influence is tending to that end. Even our better judgment, which in construction

matters moves about as slowly as the mills of the gods, dictates it.

The big influence naturally is cost. From year to year construction is becoming more expensive. And the more expensive it becomes the longer we will want it to last. This will apply to our homes as much as to our business blocks and public buildings. For in the finality it is the taxpayers, and that's us, who pay the construction bills.

Some of them, of course, we pass along to posterity in the form of bond issues. And while few of us worry about what our great-great-grandchildren will think of us for handing them such a lot of gold-bricks, we would prefer to have the buildings outlive the bonds.

By the same token we are beginning to be more concerned about the life of the house we build. It may be about the only thing we will pass along when we snuff out, and we have an excusable human interest in desiring it to reflect our good judgment.

Something of the same spirit animated the builders of those rare old brick houses of the Colonial period still to be found, cherished for both their memories and their worth, in New England, New York, Eastern Pennsylvania, Maryland, Virginia and the Carolinas, rich in beauty and historic interest.

Every man may build himself this type of monument of common brick with perfect confidence that it will live long after him.—*Building Economy*.

Men are walking by and around people that want to buy from them, and do not know it. The DAILY BUILDING NEWS will tell you who wants to buy your products.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

**"ANTI-HYDRO" Waterproofed this Basement—
50 Feet Deep—in Water Soaked Ground**

Waterproofing the concrete work below grade in this building presented a most difficult job. Water was encountered 8 feet below grade. The bottom of the boiler room extends 50 feet below the curb. Huge pumps with a capacity of 450 gallons per minute were required to keep the excavation dry.

All concrete work below grade is permanently waterproofed with "ANTI-HYDRO" and guaranteed for 5 years, backed by a \$5,000 surety bond. The basement floor slab is 30" thick and heavily reinforced to withstand a 42-foot head of water. "ANTI-HYDRO" used throughout the mass keeps it absolutely dry!

No matter how large or small your concrete job may be—you need "ANTI-HYDRO". It permanently hardens and waterproofs concrete in one operation. Easy to use, too. Being a liquid, it mixes readily with the gauging water without the aid of skilled labor.

Twenty-five years of continuous use prove the merits of "ANTI-HYDRO". Once you use it, you will never pour concrete without it. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

WINTER WORK?

"Inside" Information on Ten Ways to Make Money in Zero Weather

By JAMES E. SEVERN

The first snowstorm has had a tendency to cause more cases of "cold feet" among builders than anything else. Yet there are a number of exceptions to prove that, instead of becoming a season with which comes the inherited right to hang up the hammer, the trowel and the paint brush, winter is really a season of new opportunities for the builders who will put on their thinking caps.

This article outlines a few ideas for developing profitable and comfortable forms of winter work and will no doubt start you thinking of many others.

Keep in mind that when cold weather makes its appearance people spend much more time indoors than at any other time of the year. It is at this season that they appreciate the comforts and conveniences of adequate shelter. It is at this time that they are forced to realize the shortcomings and inconveniences of out-of-date houses.

On those snowy days when the children must play in the house, their mother will doubtless be in a receptive mood for suggestions about a playroom in the attic or in the basement!

In practically every house in the United States there are unused spaces that can be brought into service. And this type of work may be done without serious inconvenience to the occupants. You'll not be bothered with icicles or snowdrifts in the cellar or in the attic. These areas offer exceptional possibilities for a wide range of practical treatments.

What would happen if a building company sent out several energetic salesmen equipped with portfolios of attractive pictures illustrating the many delightful and practical results that can be attained in homes that are not one hundred per cent. livable? Let them ring the same doorbells that have tingled to the tune of a dozen automobile salesmen, refrigerator salesmen and others. They could show a dozen different uses for that now dark and damp cellar—they could picture a comfortable extra room or two in the bare, stuffy attic, and so on, down a list of improvements in which every home owner has a genuine interest.

Solicitation of this sort is bound to be successful if properly conducted. In the first place it represents a sound, practical service. The market has barely been scratched. And sales resistance is at a minimum, because deep down in everyone's heart is a desire to keep his home up-to-date and make it more comfortable and more efficiently equipped.

It would not be difficult to prepare a small leather-bound sales manual in which

Clausen Service—

could be plainly pictured the modern things that make a home pleasant and livable on every floor. Good photographs are available through your building supply dealer or manufacturers of insulating materials, built-in equipment, built-in furniture, flooring, heating equipment, paint, etc. Illustrations from catalogs and advertising pieces may often be used. You can show home owners many things they never realized about their homes—you can start a modernizing movement! Once you succeed in starting a family on improvements it will lead to much more business than planned.

"A six-room house becomes an eight-room house in two weeks at a cost of \$825" would read a typical statement relative to that type of work which reclaims the unused area of houses.

A Selling Kit

Then, in this age of color, pleasing finishes and attractive textures, flooring always holds the home owner's interest. There is a tendency towards fewer carpets and rugs—a floor that may be quickly and easily kept clean.

A splendid way to show the beauty and explain the durable qualities of various flooring is to finish in various ways small samples of different types of flooring. Make up a kit of these pieces which can be shown to prospects—let them feel the smoothness, inspect the grooves, admire the grain.

One of the first things to be noticed in any home is the finish of the walls. Whether painted, paneled, papered or textured, walls have always been a problem for the home owner. Knotty pine is coming back strongly into favor and there are many good illustrations available which show the beauty and permanence of this type of finish. Many other woods are also being successfully used. Paint for walls and woodwork and plastic texturing materials for walls and ceilings are other items that interest the home owner and may bring winter profits to the builder.

There is room in almost every home for a corner cabinet, more complete cabinets for the kitchen, a bathroom cabinet, modern medicine cabinet, cedar-lined closets, an incinerator, package receivers and other efficiency units.

Everyone is conscious of the trend towards two bathrooms in the average small home. Even though the fixtures may be a large item in the cost, there is a very generous share of profit in this type of work for the general building contractor. In addition to the regular tile, metal, asbestos and composition sheets finished to imitate tile and marble offer possible treatments for the walls here (and also for the kitchen).

Everyone enjoys the comfort of a fireplace that works properly. This factor in construction has undergone great im-

provement in the last few years. There are now special units which can be installed to trap the warm air generated and throw it back into the room through grilled vents. Many new, attractive designs and better working equipment make it practical in some cases to replace old construction that is unsightly and smokes up the whole place.

Winter is also the ideal time for installing new electrical outlets and equipment, for scraping and refinishing floors, for repairing cracked ceilings and walls, and for insulating the interior garages.

It is all very well to sit back and say these are swell ideas and no doubt we could dig up a lot of business in this type of work, particularly as it can be easily done when the thermometer registers below zero, but that will not bring in orders!

You have got to tell your story to the people in your town. You've got to keep the ball rolling until the job is closed!

As a further help to merchandising in this fertile field, several agencies have been formed which offer finance plans for remodeling and improvement work equal to any of the existing plans employed in part-payment selling by competitors of the building industry. It is, therefore, a simple matter to say to George Johnson, "This new room in the attic, a linen closet, as your wife suggests, and a new sink will cost you twenty-five dollars a month over a period of eighteen months." And furthermore, you have no money tied up, the job is done and paid for. With this kind of promotion it will be a busy winter for the builder who goes out and brings in waiting jobs.—*Building Age*.

INTERESTING REPORT BY STANDARDS BUREAU UPON TESTS OF BRICK

Architects and engineers will be interested in a very comprehensive report of the investigation of the compressive

strength of brick walls, completed some months ago by the United States Bureau of Standards, which appears in the October issue of the Bureau of Standards Journal of Research.

The report covers the compressive tests of 168 walls of common brick, each 6 feet long and about 9 feet high, and of 129 wallettes, about 18 inches long and 34 inches high. Four kinds of brick, three mortar mixtures, two grades of workmanship, different curing conditions, and ten different types of masonry, three solid and seven hollow, were the variables.

A very complete study was made of the strength properties of the brick. Compressive tests edgewise and flatwise, wet and dry; transverse tests edgewise and flatwise; tensile tests of whole brick, and absorption tests were made, each average being obtained from tests of 50 bricks of each kind. Shearing tests on a smaller number of samples were also made.

The results of these tests lead to the following conclusions:

1. The average strengths of solid walls built of end-cut Chicago brick (average compressive strength of half bricks flatwise, 3,280 lbs./in.²) were as follows: Lime mortar walls, 287 lbs./in.²; cement-lime mortar walls, 587 lbs./in.²; cement-mortar walls, 661 lbs./in.². A contract for building test walls was let, on a lump-sum basis, to a brick mason who specialized in small contracts. The work was done without supervision and was characterized by absence of mortar in the longitudinal vertical joints and deep furrowing of the horizontal beds.

2. With carefully supervised work-

manship, the average strengths of solid walls which were built by another mason hired by the day without regard to output and which had completely filled vertical joints and smooth spread horizontal mortar beds were as follows:

Chicago brick: Compressive strength of half brick flatwise, 3,280 lbs./in.². Average compressive strength of solid walls—cement-lime mortar, not determined; cement mortar, 895 lbs./in.².

Detroit brick: Compressive strength of half brick flatwise, 3,540 lbs./in.². Average compressive strength of solid walls—cement-lime mortar, 945 lbs./in.²; cement mortar, 1,145 lbs./in.².

Mississippi brick: Compressive strength of half brick flatwise, 3,410 lbs./in.². Average compressive strength of solid walls—cement-lime mortar, 1,300 lbs./in.²; cement mortar, 1,550 lbs./in.².

New England brick: Compressive strength of half-brick flatwise, 8,600 lbs./in.². Average compressive strength of solid walls—cement-lime mortar, 1,875 lbs./in.²; cement mortar, 2,855 lbs./in.².

3. The strengths of the solid walls were more closely related to the shearing strength of the bricks than to any other strength property measured. The compressive strength of the half brick flatwise appeared to be the next best measure, and was better than the compressive strength on edge, the modulus of rupture, or the tensile strength of the bricks.

4. On the average the compressive strength of the wallettes was by far a more consistent measure of the strength of the walls than any of the brick strength values. In predicting wall strengths from brick strengths, effects of mortar and workmanship must be taken into account, while from wallette strengths, only a single value need be determined. These tests show that the average strength of

the walls was from about 60 to 90 per cent. of the average wallette strength.

5. The strength of the solid walls, which were built by contract, varied about as the cube root of the compressive strength of the mortar cylinders (2 inches in diameter and 4 inches long) which were made from the mortar of the walls and cured under the same conditions. For the solid walls built under careful supervision the increase in strength for cement mortar walls over those laid in cement-lime mortar was about 20 per cent. for walls of Detroit and Mississippi brick, and about 50 per cent. for walls of New England brick, while the average ratio of the cube roots of the mortar cylinder strengths (cement and cement-lime mortars) was 1.38.

6. With brick, the cross sections of which close approximated rectangles, the strengths of the hollow walls varied about as the net areas in compression. When the bricks were warped, the strength of the hollow walls was found to be less than that expected from the net area.

7. Construction data show that there is a saving in materials and in time for hollow walls of brick as compared with solid walls.

8. The condition of the horizontal mortar beds in the walls affected the wall strength. Walls in which the beds were smooth were stronger by from 24 to 109 per cent. than walls in which the mortar beds were furrowed.

9. Walls laid in cement mortar and kept damp for seven days after construction were not stronger at the age of 60 days than similar walls cured in the laboratory under ordinary conditions.

10. The results of the wallette tests in which the same variables occurred as in the larger walls lead, in general, to the conclusions deduced from the wall tests. —*Building Economy.*

INSURE OWNERS AGAINST DEFECTS FOR FIVE YEARS

"Guaranteed for five years" states the bronze plaque set into the masonry of houses by The Builders, Inc., who recently made their entrance into the San Francisco fine residence field.

Twenty-eight points in construction that make possible the giving of such a guarantee have been listed by The Builders, Inc., which cover most of the essentials of the building of a "life-time house."

Here are the twenty-eight essentials:

1. Concrete foundations reinforced with reinforcing steel.

2. The cement used in all basement foundation walls has been thoroughly waterproofed to make dry basements.

3. The outsides of all basement walls below grades waterproofed with hot pitch, thereby double waterproofing basement.

4. Mud sills completely coated with tar and creosote before laying to prevent any moisture rising from the cement into the walls and stop any action of dry rot.

5. Nothing but high grade of lumber used throughout. No dry rot, wind-shakes or loose knots permitted in any wood in the building under any consideration.

6. First grade clear oak, maple, teak or mahogany flooring throughout, except in bathroom, kitchen or other specified rooms, where tile or linoleum is used.

7. Complete insulation against heat and cold in floors, walls and ceiling with best grade insulation, making home warm in winter and cool in summer.

8. Building completely sound-deadened and dampproofed.

9. Positively only best grade of plaster used—hard wall gypsum plaster or stucco inside.

10. Three complete coats of plaster used, two coats not being enough for high-class work.

11. Machine-mixed plaster (no box and hoe method) insures proper mixing, giving greatest possible strength.

12. Complete drying between coats of plaster. No rush plaster job.

13. Only nationally advertised heating equipment, fully guaranteed, used.

14. Furnaces large enough to heat the entire house at once.

15. Heating systems used are certified heating systems which are most effective and most economical to operate. They are guaranteed by the heating contractor and also manufacturer who makes the heating plant, and also by Certified Heating Association.

16. Only best quality paints, varnishes and enamels. Positively no ordinary grade used.

17. Four complete and separate coats of paint on all woodwork. Two and three-coat work is generally used.

18. Three coats of paint outside, using

pure white lead and linseed oil paints only.

19. We positively guarantee our paints to be made up of the best oils and pigments procurable.

20. Full-length bevel plate glass decorated mirror doors.

21. Three-layer floors insulated against heat, cold and sound, except where tile, linoleum or plank floors are used. The layers are as follows:

(a) Seven-eighths tongue and groove flooring (laid directly over floor joist).

(b) Insulation—Celotex.

(c) Finish boor in oak, mahogany, teak, walnut, maple or curly birch.

22. General Electric check seal wiring system throughout, with General Electric specifications, using General Electric equipment.

23. First grade brass pipe in hot water system, eliminating corrosion, costly repairs and tearing out walls.

24. All hot water pipes covered with one inch of asbestos fiber, saving fuel and insuring instant supply of hot water.

25. Copper leaders, gutters, flashings, down spouts and brackets.

26. Cabinets in kitchen are hand decorated.

27. Hand decorating with only highest grade oil paints which can be washed freely with soap and water.

28. Full-length plate glass mirrors in dressing rooms.—*The Associated Contractor.*

ARTIFICIAL LIGHTING TREATED CASUALLY

The average man builds one home for his own use in a lifetime. Previous to its creation, or even its contemplation, he makes mental comparisons between this ideal home and the one in which he lives.

He compensates for inconveniences and disadvantages in his present abode with the thought that "When I have my home, in it I shall have this and that." And so he muses over the comforts, the conveniences or the appearance and the satisfaction he shall derive in three essentially integral parts upon which all satisfactory home building is founded. Yet he must be practical, so everything is weighed in the scales for its right to inclusion in the building budget.

As the time approaches when the deal takes more concrete form as he sees his home growing from the embryo blueprint, he gives careful thought and study to nearly all details.

A heating system providing maximum efficiency at minimum cost of installation and operation is at last decided upon. Plumbing is carefully considered. These and other items are gone over carefully, yet another of the home's indispensable aids used in every room every day is treated quite casually in most building plans. This is the matter of artificial lighting.

Has it ever occurred to you that you, too, are probably treating artificial lighting in the new home too casually to even hope for fair results?

Also, it may not have occurred to you that with understanding forethought and without additional cost when building you will find that light has latent possibilities frequently lost through ignorance of correct application.

Artificial lighting is never entirely omitted, since it is man's development of light by night, and is as essential as the very windows themselves. Yet artificial lighting in relation to its need is frequently slighted.

Quite logically, the time to provide without additional cost for a high standard of lighting is when the home is in process of construction. The position of the lighting outlets should first be ascertained; then the types of fixtures chosen, to be suited to the various rooms of the home in regard to the type of lighting, and also to be harmonious with architecture and decoration.

To be a really valuable asset the lighting of the home should first meet all practical requirements; then there is an almost unexplored field for playing with light as a home beautifier and decorator. The entire atmosphere of a room may be changed by altering the lighting in it; likewise lighting may in turn create moods through reversal.

Many details lighted in some "trick" manner, such as a torchiere, open at the back to emit a narrow beam of light upon the object, have brought to light treasures which have been hidden.

Light should never be used as raw material, and all lamp bulbs, whether in fixtures or wall brackets, will be more pleasing in appearance and more satisfactory in comfort and effectiveness if they carry shades. Yet unshaded light sources are quite common.

Since in most places in the United States today four twenty-five-watt incandescent lamps may be burned for about a cent an hour, it can be seen that the free use of light is not prohibited, but possible for all.

In summing up the investment cost in the home you are contemplating, remember that one of the valuable assets, with a comparatively low initial installation cost, will be in a high standard of lighting.

It will not only add to resale value, but also provide you with an inestimable amount of comfort and convenience, and it it will make your home a happier place in which to live, to work and to play.—*East Bay Builder.*

WHY SOME MEN FAIL

There are many causes that lead to failure.

Here is a list of the most common causes:

Finding fault with the other fellow, but never seeing your own.

Doing as little as possible and trying to get as much as possible for it.

Spending too much time showing up the other fellow's weak points and too little time correcting your own.

Slandering those we do not like.

Putting off until tomorrow something that we should have done day before yesterday.

Talking friendly to the other fellow's face and stabbing him in the back as soon as he turns around.

False belief that we are smart enough to reap a harvest of pay before sowing a crop of honest service.

Disloyalty to those who have trusted us.

Last, but not least, lack of the necessary training and education to enable us to stand at the head in our line of work.

Look this list over and check yourself up by it. If none of these causes for fail-

NEW TYPE FLOORING HELPS MAKE 100-STORY BUILD- INGS POSSIBLE

The long-cherished dream of many architects and builders—to erect 100-story buildings—may now be realized as the result of the development of a new type of electrically welded flooring which materially reduces the weight of the structure. The new floor construction, known as the "battledack" type, was announced and given its first public demonstration at the Seventh Annual Convention of the American Institute of Steel Construction, Inc., at Biloxi, Mississippi, November 14.

A sample structure was erected at Biloxi. The demonstration flooring was constructed in the presence of the Institute membership, using steel-plates and structural steel beams. A special General Electric automatic arc welding machine "stitched" the plates and beams together to form the flooring. The resulting structure met all specifications and tests satisfactorily.

According to the American Institute of Steel Construction, probably no part of a building structure, under present conditions, has been more unsatisfactorily developed than the floor panel construction, and yet it is the only reason for constructing a building. Modern methods of construction involve the use of materials, in the floor panels, which constitute a dead load that generally weighs considerably more than the live load which is to be supported. This excessive dead weight of the floor panels must be carried into the skeleton frame, girders and columns, and ultimately to the foundations. It is, says the Institute, therefore evident that one of the conditions which limit the heights of multiple-story buildings will be the capacity of the foundations to carry the dead load of the structure, which is greater than the calculated live load. A reference to the column schedule of a

multiple-story building will show that the column stresses for dead loads are often approximately two-thirds of the total stress, the other third being live load.

Engineering practice and code requirements, the Institute explains, recognize that the probability of the contemplated live load being simultaneously applied to all floors of a building is very remote, and therefore it is permissible to assume a very substantial reduction in the specified live load for designing the lower story columns and foundations of all tall buildings. This permissible reduction does not apply to the dead load, which is, of course, always present.

The new flooring was developed by the use of steel plates and structural steel beams. It is, according to the Institute, better than any floor that has been used before, and will stand every service to which the floor may be subjected. It is a floor in which it is possible to determine in advance the stresses in all parts, and a floor which will recover instantly one hundred per cent. of its deflection caused by live loads, when those loads are removed. It may be expected that one of the first objections made to this type of floor will be that it has not been used before, and is, therefore, without precedent. This objection is not sustained, however, since steel plate floors have been used for the charging floors of open hearth furnaces and for the decks of battleships, where they are subjected to the most severe service known.

A special electric arc welding machine, operating automatically, has been designed by the General Electric Company for this application, and one of the new machines was used at Biloxi to demonstrate the construction of the sample floor.

This machine consists of a three-wheeled, self-propelled vehicle driven by an adjustable-speed motor. On the framework are mounted a wire feeding device, a reel of welding wire, the travel motor and the control devices—all occupying a space of less than five square feet and having a height of two feet. A motor generator at a remote point supplies,

through a trailing cable, the current for welding—and for operating the travel motor. The speed of travel and the speed of the welding wire feed can be varied easily by adjusting small rheostats, thus making it possible to suit the operation to any particular set of circumstances.

In the demonstration at Biloxi a completely satisfactory weld was accomplished at a speed of $9\frac{1}{2}$ inches per minute.

In operation the machine is placed on the beginning of a seam, where it is lined up and started running. If by any chance it should tend to deviate from the seam during the course of travel, it can be easily steered by means of a small steering wheel on the mechanism. At the end of the seam it is merely necessary to turn the machine around and place it on the beginning of the next seam, proceeding from this point as before until all seams are welded.

The new floor is described by the Institute of Steel Construction as being a solid steel deck, which acts as a girder to prevent any torsional distortion of the building when subjected to wind or earthquake action. It enables the engineer to select that part of the structure which is to carry the wind stresses to the foundations, and to be assured that the deck flooring will deliver the stresses to the most rigid part of the vertical frame. The floor construction can be carried out into the walls to provide standard construction to support the outside walls. It will provide a working floor for other trades, and in many places eliminate the necessity of temporary planked floors.

The total cost of a floor constructed of three-inch I-beams and $3/16$ -inch plates, covered on the top with cork tile and fire-proofed on the under side, is estimated by the Institute as being a little over \$1.00 per square foot. It is pointed out, however, in this connection, that the cork tile floor eliminates the necessity of any other floor covering, which is always a part of a tenant's expense when using an ordinary masonry floor. The cost of a good chenille carpet alone is from \$1.25 to \$1.50 per square foot, and the welded "battledack" floor complete will cost less than the carpet and eliminates its necessity.

The new steel floor, says the Institute, is equally applicable to residences, multiple-story buildings, and bridges, and for building construction it will save from 20 to 60 pounds per square foot of floor in dead weight. In connection with a 75-story building with floor panels $21\frac{1}{2}$ feet by $22\frac{1}{2}$ feet, the saving in dead load on the foundations for each column is nearly two million pounds, and indicates that its use will permit an increase of 25 per cent. or more in the height of the building or in the number of floors without increasing the loads on the foundations.

BUSINESS WITHOUT PROFIT— IS NO BUSINESS

It is a proven empiricism, that "business without profit is no business." How often do you hear the phrase, "That's no business," generally applied to cases where there was no profit entailed in the deal.

No business can survive where the laws of economics are flagrantly disregarded—material, cost production and marginal profit must be figured. We are engaged in one of the greatest of all industries, building; consequently we should apply the most efficient methods in conducting that business. Our business consists of salesmanship, merchandising and construction. The successful builder today must know the fundamentals of engineering, the numerous markets for materials, the knowledge of color, effect and design, the principles and practice of salesmanship, the laws of finance, its source and cost.

There must be an absolute working correlation of all these essential elements of the building craft. The trouble always has been that the average builder is but partially equipped; a search of his building history reveals that he was formerly a journeyman carpenter, in some cases elevating himself to foreman or construction superintendent. Then he jumped into contracting, not realizing what knowledge was necessary to successfully compete with the trained construction engineer.

The average contractor sincerely believes that all the requirements necessary is to be able to take off the material from the blue prints, add a little over and above the labor cost, and if the owner or architect outfigures him—well, he, the contractor, can make it up some way or other. This appalling condition is common practice with most so-called contractors; the trained engineer knows that many jobs are awarded at a figure impossible to complete the job, especially amongst the subs. They must lose on the job. Not even a miracle can save them. Yet every day jobs are being let at these suicide figures, for it certainly is business suicide to take work at a loss, and then hope that something will come up to pull you out.

You bet, this is no business; it is ruin, of course. If you have no desire to keep in business, go ahead and pursue those methods. If enough of you go broke, it will give the legitimate contractor a chance to make a living, and when the problem has resolved itself into a condition where only those contractors are left in the field that understand the business from all angles, then the contracting business will be a business, and not the cut-throat game it is today. — *East Bay Builder.*

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

HYDRAULIC JACKS FOR SOIL TESTING

At the site of the Milwaukee County Court House load tests on a particular type of concrete pile new to Milwaukee conditions were recently made. The method employed by Mr. E. D. Steinhagen of S. M. Siesel Company, contractors, replaced the laborious and not altogether satisfactory process of balancing an actual weight upon the pile to be tested.

Instead a crude crib was erected and filled with approximately 100 tons of dirt to act as a "back-stop" for the Blackhawk jack which was interposed between the pile and weighted crib. Each pile tested was carefully levelled and a steel plate grouted over the top. The jack was placed on plate and on it was a 12x12 inch timber which extended to the crib bottom.

A light cable fastened to the steel plate was run over pulleys and connected to a long multiplying pointer, which registered ten times the actual deflection of the pile on a scale.

The initial pressure exerted by the jack was ten tons and this was increased ten tons each half hour until thirty tons had been reached. Deflections were recorded periodically. While thirty tons pressure with a maximum deflection of 30/100 of an inch is sufficient to meet the Milwaukee Building Code, the experiment was carried a few steps further. The pressure was now increased five tons each half hour until a total of forty-five tons pressure (50% over-load) had been reached. This pressure or load was allowed to remain for twenty-four hours.

According to the engineers in charge of the test it was especially interesting to note the accuracy with which the varying pressures could be applied through the hydraulic jack and the extreme ease of operation.

BIG BUILDINGS TREND TOWARDS COMPACTNESS

*Mechanical Draft Reduces Size of Power
and Heating Plants; Bowls
Over High Chimneys*

Widespread adoption of mechanical draft for boilers and furnaces, as well as new developments in artificial cooling, has solved the heating and power problem for new office buildings, hotels, athletic clubs, power houses and other structures, according to the testimony of expert building engineers.

With the demand for electrical energy the greatest in the history of the power industry, and with increasing needs for more compactness and size in buildings of all kinds, fan-driven air for proper combustion of fuels, draft for fires and cooling of boilers has raised the capacity of individual plants tenfold, the engineers say.

No longer are unsightly chimneys—standing hundreds of feet in the air—so imperative to high power production and efficient heating. Giant chimneys are being bowled over by the modern genii of the up-to-date boiler room—forced and induced draft. Power house engineers declare that chimney draft could not possibly be adequate to meet the requirements of the modern power station or even the power plant in a large office building. It was pointed out that without mechanical draft, chimneys would have to be built to phenomenal and unheard-of heights.

And of equal importance to any municipality, too, is the fact that more efficient combustion of fuel by means of mechanical draft is playing a major part in eliminating the smoke nuisance. When coal is thoroughly burned, there is a minimum of soot and cinders to pour out over the city, so that with blower systems of supporting combustion, the solution of the smoke problem from large power plants is a comparatively easy proposition.

A super-power plant recently built by the New York Edison Company, for example, emits comparatively small quantities of a browned haze from the stack. This plant burns immense quantities of pulverized coal. The ash, or non-combustible part of the coal, is separated from the gases by means of scientifically designed dust collectors.

Boiler plants using pulverized coal require blowers for feeding the coal into the fire box and maintaining it in suspension until combustion is complete, as well as for inducing the necessary volume of air for combustion. But blowers are used also for generator cooling and ventilation for transformers, converters, and other electrical apparatus. Only a short time since hand firing of bituminous coal was the rule and forced draft or induced draft fans operated against lower air pressures. But with the use of modern forced draft stokers, the rate of combustion has been multiplied until boilers are now designed for operating at two to four times the old rate of evaporation and require air pressures up to ten times greater.

Ventilating problems in power plants, either central stations or those in large buildings, are numerous and varied. The ventilation is largely made necessary by the increasing cost of building and the value of the space occupied. It is only by mechanical ventilation that most of the power plants and transformer stations built in the last few years could operate, the engineers declare. Battery rooms, condenser wells and switch-houses are also commonly designed with a view to forced circulation of air for cooling.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

Insurance
Company"*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

PARISH HOUSE OF FIFTH AVE. PRESBYTERIAN CHURCH
JAMES GAMBLE, ROGERS ARCHT., JOHN DOWNEY INC., BUILDERS

ANTI-HYDRO Prevented Mortar from Freezing

This building was started late in the fall. Cold weather set in before it had proceeded very far. "ANTI-HYDRO" was used for damp-proofing and waterproofing cement mortar in walls above grade. In addition to producing an absolutely dry job, "ANTI-HYDRO" also prevented the mixing water and the mortar itself from freezing. As a result there were no interruptions to work due to extremely cold weather.

It is far more economical and safe to use "ANTI-HYDRO" for waterproofing buildings while you are erecting them than to try to dampproof them after they are completed. "ANTI-HYDRO" is extremely easy to use. It mixes easily with the water used in wetting down cement mortar and concrete.

For 25 years "ANTI-HYDRO" has proved its value as a permanent concrete hardening and waterproofing agent. Use it on your next job for guaranteed results.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that. If you don't get into it the "kick" of salesmanship, it is going to miss by just that much the pulling power it ought to have.

will be skinned for all the law will allow and then some. Such practices are on a par with those of the lawyer "ambulance chasers" who have been driven out of existence recently in New York.

It is legitimate for an engineer to be employed for a stated fee to redesign a plan to use another type of construction or a patented system of construction which the original engineer may hesitate to use because the patented system would be non-competitive in the first instance. This does not involve any injury to the professional standing of the original engineer. It is usually required that redesigns must be approved by the original engineer. Both are paid their stipulated fee.

The contingent or "half-the-savings" fee system is not only unethical but conducive to practices that reputable engineers do not engage in or approve. There should not be any place in the engineering profession for the "half-the-savings racketeer" engineer. He does not of course belong to the local organization of his profession.

And now *The American Contractor* has taken exception to a statement in Bulletin No. 4, reading: "Is there any valid reason why the structural engineer and the mechanical engineer should not be employed directly by the owner on a parity with the architect?"

Quoting the esteemed *American Contractor*: "In a great many instances both structural and mechanical engineers are already so employed, but what we are interested in is how such an arrangement affects the builder. (Italics ours.) Experience has shown that expedition is re-

tarded, cost is increased, and there is a greater chance of errors and disputes when responsibility and authority is too finely divided. . . The builder today who is in a position to furnish engineering service (and there are hundreds of such organizations) has found that this gives him an advantage in not only securing work without entering into the free-for-all competitive projects, but also in giving a service to the owner that means a greater economy than any amount of price cutting could produce. This is possible only where such engineering service can be produced exactly where and when it is needed and to have such service available, it should properly be a part of the contractor's organization."

Well, well, this is one of the most refreshing indecent exposures of double-distilled egotism and supreme selfishness to be observed in a long time. With rare restraint *The American Contractor* has not advocated the elimination of the independent architect along with the independent structural engineer and everybody work for the contractor. Suppose the contractor assumes the functions of the architect and engineer, what then? In New York there are some examples of contractor-architect-engineer buildings and that is enough. Unfortunately, there is no way to prevent the "blots on the landscape" output of such organizations.

Bulletin No. 4 meant exactly what it said. The architect's fees as established today are inadequate for the mere planning of the complex modern building and the vast amount of administration and co-ordination work required and yield an adequate profit. Either the architect's

fees should be greatly increased to be profitable and provide an adequate fee for the structural engineer whom he employs, or better, both the architect and the structural engineer should be paid larger fees and be employed by the owner independently.

The independent structural engineer is better qualified than the contractor's engineer for two reasons: He has a much more diversified practice and experience which broadens his knowledge and he is not dominated by the contractor's buyer who knows only three words—cheap, cheaper and cheapest.

Recently Dow's Service reported that contractor's profits in New York for the first half of 1929 were 2%—excepting the cost-plus contractors. Let this sink in.

A firm of New York "contractor-engineers" of post-war vintage has recently completed a well known structure. It said "there are enough sub-contractors in New York to take us ten years to break them all." Enough of them went broke on the aforesaid building. Let this sink in.

And yet, *The American Contractor* would have the contractors swallow the structural engineers and eventually the architects! It has another think coming!

Lest we forget:

Correct relations are the basis of social and economic welfare.

On the structural frame hang all of the building and its contents.

Industry intends to take a profit from the financial deflation, declared Charles F. Abbott, Executive Director of the American Institute of Steel Construction today in an address to the structural steel salesmen meeting at the Copely-Plaza Hotel under the auspices of the Structural Steel Board of Trade of New England. Mr. Abbott explained the scheme of co-operation worked out by his industry with the national committee created at the request of President Hoover.

"We expect no slack in business," said Mr. Abbott. "On the other hand, we have good cause to expect an increase in sales along numerous lines. An \$8,000,000 program of building from architectural plans during 1930 is not an unreasonable expectation. In the bulk of this building structural steel will be used. This industry, however, is not entirely dependent upon architectural construction as fabricated steel is used in bridge building, including projects on which architectural assistance is not utilized.

"Since 1921 the construction industry has grown to large proportions although the total building during 1929 will probably be ten per cent. less than during 1928. The 1929 decline was due in large measure to the higher cost of money and the difficulty of selling real estate mortgages at rates deemed reasonable. Had

PARK 4147-4148

money been cheaper during 1929 the volume of building would have set a record for this country. This prophesy is based upon the estimated number of projects on the board of architects during the year.

"Structural steel, however, has enjoyed an extremely prosperous year despite the ten per cent. decline in building generally. The decline was recorded in individual homes, whereas heavy construction projects increased in 1929. A total of some 1,118,000 tons of structural steel was sold in 1921; the sales in 1929 will approximate 3,990,000 tons. This increase during 1929 was recorded in the face of an advancing wholesale price of the material.

"Increased sales of structural steel have been made possible because of the great economies in this type of construction. Prior to 1914 the industry paid labor \$5 per day for erecting steel, today labor is paid \$15 a day in New York. Despite this tripling of the wage cost, improved methods of design, fabrication, handling and erection have kept the cost of structural steel down to a figure comparable to the pre-war cost. It has, however, made necessary a tremendous increase in the investment in equipment and tools, which accounts in no small measure for the tremendous increase in capital in this single industry.

"Statistics of the Bureau of the Census show that for the first ten months of 1929 the structural steel plants of the United States received orders averaging 86 per cent. of monthly capacity. During these same months the plants shipped out at the rate of 79 per cent. of monthly capacity. These figures indicated that there has been a considerable 'banking-up' of orders which should carry the shops over several months into 1930 even though no new orders are received immediately. Architectural plans on the boards, however, indicate that there will be no letting up in this business.

"Numerous schools, hospitals and other public and semi-public buildings were postponed during 1929 owing to the difficulty of floating the necessary bond issues to cover the cost of erection. Interest rates were too high. Several factory projects were postponed until borrowing became easier.

"Owing to the flexibility of the material the industry foresees a constantly increasing market for structural steel. It is not dependent entirely upon the building of bridges and buildings, factories, skyscrapers, etc. Structural steel is used to a considerable extent in the building of airports, hangars; in the utility industry in the construction of transmission towers; in hydraulic projects in the construction of dams, and in canal locks, etc., incident to the increased waterways planned for the country. Measured in general we foresee innumerable oppor-

tunities for the industry during 1930, although it will be necessary to measure the soundness and economy of each project by the local conditions.

"We are inclined to view an annual building program of \$7,000,000,000 in the United States as something above a normal record. While we have reached that figure or approximated it during 1928 and 1929, it is by no means excessive. The construction industry must be measured by the long trend, with full recognition of the fact that it has the 'war years' to overcome when no building was allowed. Seven billions of dollars in buildings is not above the normal and will not care for the normal increase in the population and the business of the country. In this \$7,000,000,000 we must reckon at least \$4,000,000,000 spent to bring old or obsolete buildings up to modern standards. Improvements in housing and new standards of excellence require the scrapping of numerous old buildings and the rebuilding of about \$4,000,000,000 annually. It should require the expenditure of an equal sum again to care for the normal increase, wherefore we believe that an annual expenditure of \$8,000,000,000 a year would more nearly approximate the building needs of 1930."

BRICK'S PERMANENT COMPLEXION

Somewhere, recently, the statement appeared that approximately \$5,000,000 were being expended annually by the women of the country for cosmetics and the various preparations necessary to keep the complexion fresh and radiant. For better than men, the women appreciate that appearances count.

It requires several applications of the lip stick to keep the lips cherry red throughout the day. One application of sun tan is supposed to be ample for any day, but frequently it isn't. Rouge is af-

fected by perspiration and powdering the nose becomes a habit.

But no up-to-the-minute woman neglects her complexion. It just isn't done. One must respect appearances.

It is much the same with houses. Appearances must be kept up. And it would be interesting to know just how many dollars it requires to keep the complexions of the nation's homes in satisfactory condition.

Brick home owners are peculiarly fortunate in this respect. They don't have to worry. The brick house requires no rouge to freshen its complexion. Its beauty is burned in. It does not fade. It lasts.

It but mellows and softens and becomes more appealing with the passing years.—*Building Economy.*

IT MAY OR MAY NOT BE SO

Usually when a man cannot see or understand how it was that he did not get the job, he immediately looks around for a reason.

The sub-contractor knows that the price he made was as low as the job could be done for, and the general contractor to whom he sent his bid got the job—but has not informed the sub-contractor that the job is his.

In the natural course of events, the sub-contractor meets or calls up the general contractor and says that "Jones' job is mine all right, isn't it?" To which the general contractor replies, "No, I think not, you were not the lowest bidder."

"Why," the sub-contractor ventures to say, "I understood and was told that my bid was the lowest at the time the job was let, how is it that I don't get the work?"

"Oh, well," replies the general contractor, "I don't remember whether that was so or not, but my office man figured up the total bids and I know that you were not the lowest." And that's that.

Now then, the sub-contractor is disgruntled and dissatisfied and thinks he knows why, but has no evidence to prove his contention, so he is sore and everything is wrong with him.

The general contractor questions his man about it, and the man says, "Well, you see it's this way. This fellow was the lowest bidder when the bids were opened, but sub-contractor number two came down here right after the bids were opened and said that he did not have time to get his bid in and submitted his bid, which was \$50 less than the other fellow, so I put his bid in our list—that makes us \$50 ahead to start with."

"Oh, I see," said the general contractor, "but I don't like that kind of business. It doesn't look right to me and I don't countenance that sort of thing."

"Oh, well," replies his man, "the fifty dollars is just as good to you as it is to anybody else. Besides, you know we left out about fifty dollars worth of fancy work in that hall which we admitted we had included in our bid, so that will even up things."

"Well," the general contractor responded, "I don't like that way of doing business just the same."

"Well, then—" replied the office man, "why do these sub-contractors call you up or run around after you and beg you to let them put in a bid after the bids are open. Why don't they clean house themselves?"

The sub-contractor at times thinks that the owner peddles his bids, claiming that if he is not to have the job, if he is the lowest when the bids are opened, that the owner should not ask him to figure the job if he (the owner) does not intend to give the work to him.

Just how much truth and fact are in all this supposition is problematical, but from the talk one hears bandied around, it would seem there are times when just such "goings on" do occur, else, why all the agitation against bid-peddling? If it is but a suspicion, it hurts the business, for it causes men to become disgruntled, keeps things stirred up, injures morale and should be silenced.—*Associated Contractor.*

FACE BRICK COST NEAR ALL-FRAME, SURVEYS SHOW

Additional Expenditure of Three to Eight Per Cent. Covers Difference on the Average

Prospective home builders who want the enduring beauty and freedom from upkeep that face brick brings to homes can have these qualities today at very little extra cost, according to surveys

made in various parts of the country. Instead of dismissing the thought of a face-brick home in the belief that it is beyond his means, the small home owner can possess one by investing only a few hundred dollars additional, the amount depending upon the type of wall construction he chooses.

There are four types of face-brick walls: First, the solid brick wall, face brick with common brick backing; second, face brick with hollow tile or block backing; third, face-brick veneer on a wood frame, and, fourth, the newest type, in which face brick is used with an insulated steel frame.

Steel Framing Developed

The first two types long have been recognized by building authorities as thoroughly sound construction. Both the common brick and the larger masonry units bond perfectly with the face brick and provide a solid wall that offers the utmost in fire safety with maximum strength. The greater thickness of these walls also increases the insulation value, keeping the house warmer in winter and cooler in summer.

The third type, face-brick veneer on frame, is preferred by some builders because it is somewhat less expensive to construct than solid brick or hollow tile and is more quickly erected. The fourth type, face-brick veneer on metal frame, is constructed similarly to the foregoing, with the added advantage of the fire safety and strength of the steel work.

A survey made in the Southeast by the Southern Clay Products Association lists the cost on these types in this order: Face-brick veneer, face brick on hollow tile, and face brick on common brick, with none costing very much more than all-frame.

Comparative Figures Given

A builder carefully estimated the cost of the different types of construction on a typical small house and offered to build at the following figures:

Frame	\$4,238
Face brick veneer on frame.....	4,460
Face brick on hollow tile backing.	4,483
Face brick on common brick backing	4,555

In the Middle West the slight difference in cost between all-frame and face brick veneer on frame was shown by a Des Moines, Iowa, builder, who erected two identical houses, one of frame and the other of face brick veneer. Cost records showed that the face brick house cost but \$85 more than the all-frame, or about three per cent. of the total cost.

Other comparisons of costs have revealed similarly surprising results, and it is now known that permanent construction with face brick need cost but three to eight per cent. more than all-frame construction.—*New York Herald Tribune.*

TODAY'S BUILDING ESTIMATOR

By I. P. HICKS

Mistakes Are Costly. Avoid Them by Being Sure of Your Estimate. This Book Will Tell You How

It furnishes the estimator with a handy reminder for making a complete estimate of construction work.

The book is good for twelve jobs, as there are twelve sets of blank forms to be filled in. Each form has three pages designed for taking off quantities, so that a complete bill of materials may be made. Following these are pages for tabulating estimated costs and totaling the estimate with space for record of actual cost and profit or loss per item at the completion of a job. It gives a concise, complete job record of great value. Printed on writing paper, a permanent record can be made in ink or pencil.

In addition, the book is an excellent specification reminder. There is a full material check list; data on estimating cement work, plastering, stucco, brick work, chimneys, ready reckoner timber measure and rafter table.

Methods of estimating by the square, lineal foot and by the piece are presented in a handy form, giving quantity of material and the workman's average time for a given amount of work. Presented in a series of tables, there are columns to be filled in for labor cost, material cost and total on each item. Thus, the user of the book can compile his own estimating figures based on local prices for material and labor.

Cloth, 5½ by 8½ inches, 96 pages. Price, \$1.25.

This is a useful book for the man in the building business, written by the well-known author of "Hick's Builders' Guide."

Copies can be secured from Builders' Guide, 1530 Chestnut Street, Philadelphia.

OPERATIVE BUILDERS' ELECT OFFICERS AND PLAN NINTH BUILDING SHOW

At the recent annual meeting of the Philadelphia Operative Builders' Association, held at the Overbrook Golf Club, Henry W. Bauer was unanimously elected president of the organization for the coming year. Mr. Bauer, who has held the position of vice-president for a number of years, succeeds Daniel Crawford, who has held the office of president for sixteen years.

The other officers of the association, also unanimously elected, are: Vice-President, Charles G. Erny; treasurer, James F. Nolen; secretary, Ernest H. Crowhurst, and sergeant-at-arms, Clarence R. Siegel.

John N. McGarvey, who for many years has occupied the position of chair-

man of the Executive Committee, conducted the meeting in the absence of the retiring president. McGarvey, who is also chairman of the Exposition Committee of the association, announced that the annual Home Building Exposition would be held during the week of February 3 to 8, 1930. Many new and novel features have been planned for the show, which will embrace displays of the latest product of the building industry. The Home Building Show is now in its ninth year and has no connection whatever with any other building exposition. It is conducted by the operative builders in the interest of the entire building industry.

This annual show is a "Trade Mart" looked forward to not only by builders, but also home-owners and the public at large.

Prices of floor spaces are the same as previous years, and in addition thereto one-quarter page of advertising space is given to each exhibitor in the official catalogue.

The unusual attendance at these shows is largely due to the fact that no admission fee is charged and invitation tickets are supplied in unlimited numbers, so exhibitors may distribute them among their clientele.

For further information apply to the office of the association, 1503 Finance Building, Rittenhouse 1295.

AN ALLIED CONSTRUCTION INDUSTRY, AND WHY

By MR. GEORGE B. WALBRIDGE, A.G.C.A.
President Allied Construction Industries

This is too big a proposition to let one individual or a number of individuals jeopardize it to the slightest degree. It is the business of all members of the construction industry to see that this Allied Construction Industries program is set up on a proper basis from a national stand-

point with definite assurance of standardization on the part of local groups, so that the whole fabric will dovetail together in such a manner as to render it most effective and efficient. While I am as impatient as anyone in the consummation of this project, it cannot be completed and placed in a position to operate smoothly and efficiently except at the expense of a tremendous amount of time and effort.

We in the construction industry have been contributing to the position in which we find ourselves for a great many years. There are no groups that have not at some time indulged in unsavory, unethical and unbusiness-like practices. Like the proverbial chickens, these have come home to roost.

In order to change the situation, we must start at the end of the thread to commence the untanglement process. Loose credit is the proper point for the construction industry activity. In closing, I wish to state it is my belief that with the satisfactory consummation of the Allied Construction Industry project a great burden will be lifted from the judiciary of the country; that credit losses will be reduced to a negligible quantity in the construction field; that more friendly and harmonious relations will be established between the various groups of construction; that peddling of bids will become an unknown activity; that standard contract forms will become the rule instead of an occasional practice; that the gyp contractor will be absolutely prevented from gyping; that the construction industry will be placed in a position to deal with any individual or group for the safeguards of its interests; and last, but not least, that we will accord to the public a protection and security never known before. We certainly wish to make it possible for the purchaser of a piece of construction work

to get every bit of value it is possible to give him.

We want the cost of one building to bear some sort of relation to the cost of another building of similar size, not by reason of control but because of having to operate on the same basis. There is nothing that gets the construction industry into so much disrepute as the great difference in the cost of construction projects. Values are judged by comparison and our purchasers, the public, have absolutely no standards of comparison. There are no standards in the construction industry. Stabilize the industry to a degree where the cost of one building bears relation to the cost of a similar building in size and type; and you immediately give or commence to give a standard by which the uninitiated public may commence to judge values.

However, aside from this, it is our obligation, as well as our privilege, to do everything possible to see that the ultimate owner gets as much for his money as it is possible to give him, without detriment to the construction industry. The latter phrase, "Without detriment to the Construction Industry," is important, and one that has seemingly been forgotten by many members of the industry.

Unless the construction industry as a whole is prosperous, it cannot give the kind of service which will merit the esteem of its customers. It is unnecessary for any interested group in a community to wait for a complete industry group organization. Any group can start immediately, and in so doing will influence others to join in.—*East Bay Builder*.

The extent to which new office and commercial building construction can contribute to business activity during the coming year is complicated by the fact that present buildings and buildings now under construction will give more space than can be absorbed at the normal rate, according to the statement of Paul Robertson, of Indianapolis, President of the National Association of Building Owners and Managers, before President Hoover's "prosperity conference."

"Having kept pace with, and even exceeded, the demands for commercial housing during the recent years of great business expansion," Robertson said, "we now stand with those whose interests would be seriously jeopardized by any

curtailment of the normal activity of business and industry.

"The commercial buildings of the country, representing an enormous investment of capital, are singularly dependent upon conditions entirely beyond the control of their owners. These buildings are fixed as to location, size, character and field of service. In good times or bad, they have much the same costs of operation. In the production of a return on the investment, they are limited by fixed factors and their own four walls. They produce no goods that may be carried to market in quantities and at prices subject to the laws of supply and demand, nor can they increase or create a demand for the space they have to offer. They can only serve those who require space in which to transact business. It follows that we look with high favor on such organized efforts as will tend to promote a continuance of the national prosperity.

"The question of what contribution this group may make to the program of production and construction must be considered in the light of facts relating to the business of building operation. These facts are:

1. "On October 1, 1929, vacant space in office buildings amounted to 11.55 per cent. of the total rentable area. This was ascertained in a survey covering thirty-eight cities and including 1676 buildings, with a total rentable area of 140,141,074 square feet. In May, 1929, the vacancy was 11.8 per cent.

2. "The same survey shows that in the thirty-eight cities reporting, there are under construction sixty-eight new buildings, with a rentable area of 13,680,262 square feet. New construction reported on May 1, 1929, amounted to 10,452,211 square feet.

3. "New buildings now under construction will add nearly 10 per cent. to the present supply of space. A major portion of this new space will be on the market on or before May 1, 1930. Assuming the rate of absorption that has prevailed in recent years, we may anticipate a vacancy in May, 1930, of 16 per cent.

"The conclusion to which these facts point is that there is an abundant supply of office buildings in the principal business centers of the country. Moreover, present construction and other buildings definitely projected will add during the coming year more space than can be ab-

sorbed at the normal rate. It will be seen, then, that in the office building field a continuance of good business has been anticipated.

"The construction program in this industry therefore already under way and certain to be completed within the next year, amounts to approximately \$250,000,000. To this should be added another \$50,000,000 which present buildings will spend for alterations and improvements during the year, making a construction total of \$300,000,000.

"Needless construction projects would hinder rather than promote the common good. Idle space in buildings mean idle capital. We have seen that the vacant space in office buildings exceeds 11 per cent. of the total and that new construction will add to the supply a volume almost equal to the existing vacancy. The amount of office space estimated to be vacant on May 1st next will represent an unproductive investment of half a billion dollars. It is plain that any further encouragement to construction would result in an inflation that could result only in a very real economic loss.

"The business surveys of the National Association of Building Owners and Managers will show, from time to time, in what communities and in what regions new construction may be encouraged with safety. Assuming no abnormal or unexpected conditions to unsettle the normal status, we propose to encourage throughout the country a comprehensive program of rehabilitation, modernization and repair of buildings and their mechanical equipment. This would include structural changes, the renewal of worn out parts and the repair and redecorating of existing buildings. To this will be added similar treatment of all mechanical equipment including elevators, heating plants, plumbing and electrical installations. Such a program would follow an organized inspection and analysis of all available properties and should result in new business and employment in the construction industry and its allied trades."

RADIATION—PRO AND CON

By Elizabeth Cole

Radio fans abound and recently we are finding radiation fans, especially in the summer. Sun worship of the pagans was no more faithfully pursued than some people nowadays trustfully court the healing powers of golden Apollo. His efficacious faculties are great too, yet like everything else when carried to excess, he can be as strong a force for harm. Why? The curative and beneficial value of the sun is due, not only to the heat, but also to the light given off. Light is an antiseptic and a stimulant. In certain doses it builds up resistance and gives vigor. The light of the sun also acts as a mental stimulus. On a bright sunshiny day our

spirits are gayer and we feel glad we're alive.

The sun, on the other hand, may have an opposite effect. Under some circumstances and in too sudden or prolonged doses it will produce headache, fever, sleeplessness, loss of appetite, and weariness. Anyone who has suffered from a severe sunburn knows only too well that something serious has happened to his whole system as well as to his skin and that may have blistered.

Because of all the recent interest in sun baths and sunshine treatment and for the benefit of the growing number of radiation fans it may be interesting to explain briefly why the sun has these various attributes. Sunlight, as we see it, is only a very small part of the radiations given off from the sun. When the visible light from the sun passes through a glass prism it is broken up into component parts to form the well-known spectrum of colors—red, orange yellow, green, blue, indigo, and violet. Scientists have proved that beyond the violet rays there are invisible rays or ultraviolet rays. It is these rays that are as important if not more so for some conditions than the visible rays.

Although Herodotus in the fifth century B. C. taught the uses of sunlight as a treatment for certain diseases, it remained for Dr. Rollier of Switzerland to connect the physical benefits of the ultraviolet rays with the ancient knowledge of sun cures. He discovered that these ultraviolet rays were more effective in higher, clearer altitudes—that ultraviolet radiation became greatly diminished in congested, smoky cities. His successful clinic for the treatment of bone and joint tuberculosis at Leysin in the Alps, founded twenty-five years ago, has been an example for many others in foreign countries as well as here in the United States.

The sunbath should be taken out-of-doors in order to get the most benefit

from these valuable ultraviolet radiations. We should expose our bodies gradually—only ten minutes at first and then increase the length of time by degrees, depending on the season of the year. Yet we of the modern day and generation who rush impulsively into everything, are inclined to get our sunshine in too concentrated doses. Into two weeks of vacation we crowd our sunbaths and then the good old Sol is forgotten for another year. We want to come back from a summer holiday and impress our friends with our beautiful tans. We would do well to spread our enthusiasm throughout the year. Just how much daily dosage of ultraviolet rays the average person needs to keep healthy is difficult to say. It varies with the individual. Therefore if we expose our nude bodies in taking sun medicine we should always do so under a physician's orders.

Recently artificial sunlamps that guarantee to supply ultraviolet rays have come before the public attractively advertised as wonder workers. There are many on the market, good, bad, and indifferent, but they should never be used except on the physician's instructions. Certain window glasses, too, are alleged to permit ultraviolet rays to filter through and give the benefit of real sunlight. Some are good but very expensive and the cheap ones are of little value. E. E. Free in a recent article on "These Ultra Violet Rays" in *Harper's Magazine*, says that the artificial sunlamps threaten to become as common an article of household furniture as vacuum cleaners. He also says that instead of depending on them a better plan would be to spend a few minutes in the outdoor sun. Ten minutes in the sun out-of-doors is of as much value as hours spent with most of the substitutes. It must be remembered for the present that they are still but a recent invention. Before fitting out a home with sunlight

substitutes the wise person will consult authorities on the subject.

It may seem strange to be writing of radiation fans in the cold winter months but as a matter of fact the winter sun should be as alluring as the summer sun. Although we of the North cannot sit about in low-cut bathing suits on sun-drenched beaches during the cold season we can sit on the porch, in the park, on the doorstep, or on the roof. We need the healthy benefit of the winter as well as the summer sun.

Inasmuch as sun radiation, or heliotherapy as it is called, is used in the treatment of tuberculosis, specialists in this disease are especially interested in the increasing number of radiation fans. Experiments are constantly being made by the Research Committee of the National Tuberculosis Association to find out all the best methods for preventing and curing tuberculosis. At the present time the tendency is to snatch quickly at fads while experience has taught that it is best to proceed slowly and cautiously. Naturally sunshine is an excellent tonic and most of us get too little of it. Yet we must be intelligent in our usage of sunshine as a medicine on naked bodies.

Christmas seals sold in December support the work of the Research Committee as one element in the campaign to control tuberculosis.

—*Architecture and Building.*

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its hosts of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public associations tending to overcome the natural habit of procrastination.—Making advertising pay.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

ANTI-HYDRO Prevented Mortar from Freezing

This building was started late in the fall. Cold weather set in before it had proceeded very far. "ANTI-HYDRO" was used for damp-proofing and waterproofing cement mortar in walls above grade. In addition to producing an absolutely dry job, "ANTI-HYDRO" also prevented the mixing water and the mortar itself from freezing. As a result there were no interruptions to work due to extremely cold weather.

It is far more economical and safe to use "ANTI-HYDRO" for waterproofing buildings while you are erecting them than to try to damp-proof them after they are completed. "ANTI-HYDRO" is extremely easy to use. It mixes easily with the water used in wetting down cement mortar and concrete.

For 25 years "ANTI-HYDRO" has proved its value as a permanent concrete hardening and waterproofing agent. Use it on your next job for guaranteed results.

Profitable Portable Air Power

THE Metalweld-Worthington "AIR KING" has sounded a new keynote in Portable Air Compressors. Not only does the "AIR KING" embody the most advanced engineering principles in air compressor construction, but it has actually proven its dollars-and-cents value and labor-saving ability in daily use by the leading road builders, public utility companies and railroads throughout the country.

Worthington "Feather Valves"—Force Feed Lubrication—Counter balanced Crankshaft—all-steel Welded Frame—these are but a few of the M-W features that make the "AIR KING" the outstanding buy in Portable Air Power.

Furnished in 28, 110, 160, 210, 280 and 330 cu. ft. sizes. Fully illustrated catalog on request. Write or phone Radcliffe 3471.

By A. E. FOUNTAIN, JR.,
Managing Director, Division of Architecture and Building, Lyddon Hanford & Kimball, Inc.

The world's second oldest industry, rudely routed out of its bed of tradition and complacency, stands shivering on the cold floor of progress wondering what it is to do about the new day's business. Its job is to manufacture and distribute the materials for more than eight billion dollars' worth of buildings within a year, and with the help of more than two mil-

lion people (including seven woman stone masons and 171 woman carpenters, according to the latest United States census) get the job done more efficiently, economically and more in harmony with the modern tempo than it has ever been done before.

Poked and prodded into a new consciousness by the demands of modern life, the manufacturing side of that shambling giant, America's Building Industry, finds it necessary to take unto itself new methods of procedure.

If it seems strange to you that the industry that has given us our giant skyscrapers, beautiful churches, theaters and hospitals, finds it first necessary and then difficult to revamp its methods and change its pace, first look into the necessity created by the ever-increasing costs of construction. In spite of the skill of architects and building planners, the use of simpler materials, substitute materials and large-scale production, costs are being driven inevitably upward by unscientific manufacturing, merchandising and selling and by the demands of labor.

Then consider the difficulty caused by the history of the industry. Ages old, following practices handed down from generation to generation, exacting in its demands for precision, it has become an enterprise in which new methods and processes can be adopted only after repeated cautious trials, because one small error may be fatal to the completed work.

Linked with the Past

Unlike other industries that have grown up within the past few decades depending on flexible modern methods, the building industry is rooted in tradition.

The building industry has been so much a part of our everyday life, so prosaic in its procedure, so local in its practice that it has not attracted the pioneering mind, or when it has, its conservatism and reticence are deep-seated enough to blunt any enthusiasm. Other industries have created a need and grown fat by catering to it. Perhaps the building industry has been so busy catering to an already existing demand that it has had little time to create new markets. Building is as necessary as food. No matter what the cost, the demand will always exist. Conceivably, the industry might pursue its old methods and still supply the demand. But as building demands increase, adding billion to billion in each year's requirements, the individual businesses, forced into national selling through the necessity of finding new markets, are confronted with problems that demand modern scientific methods of production, market analysis, merchandising, selling and advertising.

Perhaps the greatest obstacle now confronting the industry is unscientific production. This refers not only to the actual producing units but to the market.

analysts that set the production schedules. In many of the older branches of the industry such as iron, tile, hardware, mill-work and natural stones, a large proportion of the individual businesses is buried under antiquated machinery and plant methods that simply do not allow profitable production.

Even if production were scientifically scheduled and styled for the market, which in a majority of cases it is not, these plants could not compete either with the more modern plants in the field or with the great floods of substitute materials offered against them.

After putting its production in order, this industry must then become fully awake to the new and changed market that has grown up around it. The consuming public of building material has, within the past decade, undergone an intensive education and has arrived at a point where it not only knows a lot about materials, their uses and their worth, but has its mind well made up as to what it needs and what it wants, and will buy where it can get it.

For years this public has been sold better buildings from every angle. Little of this selling has been done by the building industry itself. Years ago, magazines started crusades for better and more beautiful homes. The business press has poured into the executive mind the advantages of better planning and construction; wide-awake architects, developers and builders have created better results.

A Few Concerns Keep Up

Automobile travel has made people visibly conscious of the possibilities that come through a better knowledge of design and materials. Here and there certain manufacturing companies, headed by merchandisers rather than manufacturers, have revamped their methods, redesigned and restyled their lines and, backed by consistent advertising, have carried their story to a receptive market with most profitable results.

When the manufacturer of a building product begins to study his consuming public he faces his greatest difficulty, because, though usually a good manufacturer, he is an extraordinarily poor merchant. To appreciate why this is so, it is necessary to go back 40 or 50 years in the history of American building.

At that time all the basic materials—stone, wood, iron and clay—were in everyday use and enjoyed a constant demand. Substitute materials were little known. Architectural design and the needs of industry were undergoing their usual changes, and manufacturers were supplying their needs. But building was a purely local operation. Wherever populations had sprung up the production of material had clustered about that center, intent on supplying its needs. Transportation was too costly to have it otherwise, travel too slow.

Climate and sectional customs helped establish this local outlook. Manufacturers of building materials quite naturally bent their efforts toward producing such things as would most nearly fit the requirements of their known market.

As these local markets grew, local building labor also adjusted itself and fortified itself with habits, customs and laws best adapted to its environment. With this came local building laws, peculiar to the location. So, taking a bird's-eye view of the whole country of 30 years ago, we see scattered across the land—a great many separate self-contained little building industries, all related as to basic efforts and ideals, but independent, almost isolated, so far as their daily practice was concerned.

Precise and Cautious

At the supplying end we find a group of men whose heritage and precedent has grown deep-rooted in the dim past of antiquity. The building mind works precisely and cautiously, leaning heavily on the past and taking nothing for granted as to the future.

All this means that today, when the manufacturer finds himself rudely forced into a national outlook because the spread of population has made purely local markets almost impossible to define and is confronted with the necessity of adapting himself and his product to a nation's needs, he faces a most amazing and complex situation. Most of us build but once, and that once must not only meet our needs but our ideals. Few of us have the same needs or ideals. Thus, when the awakened manufacturer begins to study the national market, he finds groups of individuals requiring widely different materials, designs and prices.

Even Climate Plays a Part

He will find widely divergent standards of life influenced by ancestry, climate, topography of country and business. As extreme instances of this, note the customs of using stone and brick

structures with slate roofs in Pennsylvania, Maryland and Delaware; and stucco with tile roofs in California. Throughout the country we have great differences in the hardness of our drinking water, necessitating corresponding differences in plumbing equipment. Quite obviously, heating equipment designed for Michigan would not be economical in Florida or Louisiana. We will find large cities demanding fireproof materials, and small communities not able to pay for them. We will find that in sections where wealth has come quickly, price is no factor, and where wealth is dwindling no market at all.

Local health and tenement laws vary widely, as do building laws. Recently in the city of Hartford, a public contract that had to be awarded to the lowest bidder went to a Massachusetts company simply because the bond rate in Massachusetts is one per cent. as against one and one-half per cent. in Connecticut. Only a few years ago, various divisions of the industry came under government scrutiny, several of them standing trial, accused of co-operative effort to stifle competition and maintain prices. While there was undoubtedly some ground for the accusation, it was established that geographical limitations and freight rates had much to do with what appeared to be restriction of competition.

Labor also adds to the apparent confusion in the manufacturer's study of his markets. If any manufacturer's survey of the labor market can make head or tail of it, then the surveyor should have a medal of honor for his discovery, for

apparently no man has as yet been able to do more than guess at what it's all about. In our cities where unionism is strong, it is always hard to forecast beyond a few months what may happen in the way of labor demands. In rural sections labor is likely to be so scarce that without demands of any kind it receives as much if not more than unionized city labor.

Changing style is another problem for the building mind. Style is certainly an important consideration in the mind of the consumer, particularly as applied to the more decorative products. Yet it is quite apparent that many of our large manufacturers have not yet arrived at the point where, left to their own initiative, they even display good taste, much less the ability to follow or forecast style trends.

Although building materials can hardly be classed as general merchandise, manufacturers would do well to tear a leaf from the book of experience of producers of materials sold at retail, and employ competent style counsel to help them follow the demands of a critical public.

You may never have noticed that styles in building change, but it is clear that they do. Every one can remember a few years ago when pebble-dash stucco was a vogue; and how a few years ago paint was the thing for interior walls until wall paper started to fight its way back into popular favor.

Twenty years ago reinforced concrete jumped into well-deserved favor, with steel and wood the losers. What materials so-called modern architecture will demand no man can foretell. We also find an increasing use of brick in city construction because of its economy and adaptability to modern design.

Quite naturally, styles in some materials never change, but a wide-awake producer of these materials can watch the styles in

materials that do change and revamp his product accordingly. But let no man rest secure in the belief that his product is free from change, for we are just at the dawn of the substitute age in building materials.

And Then Comes Distribution

Many manufacturers with a farsightedness akin to genius, having pulled themselves out of the quicksands of production with materials in every way adapted to the new market, find themselves enveloped in the dense fog of distribution. If it is a problem to manufacture for today's building market at a profit, it is a greater one to distribute it. The fatalities occasioned by distribution are far greater than those occasioned by production.

With well made and properly priced and styled materials, and with a known and eager market clearly defined, it seems a simple matter to get wide and economic distribution. But let us review a few actual cases and see whether it has been such a simple matter.

A few years ago the production of plaster wall paint, the material that produces the rough textured surfaces that have until lately been so in demand, came into being in answer to a public swing in taste. One company, getting into the market in the early stages of the demand, went direct to home owners via decorators and architects with its story, and quickly built up a profitable volume of sales.

Within a short time, however, and in spite of a wide spread between its cost and sale prices, it became evident that no great profit would come even with ever-increasing sales. Evidently something was wrong. An exhaustive analysis revealed the trouble. It was the painters of the country. They had to apply this material and seemingly should have welcomed the opportunity to cash in on the new and easy work that popular demand

for this material afforded them.

The Role the Painters Played

On the contrary, and quite inexplicably, it was discovered that, although not antagonistic, painters were extremely apathetic toward this material and would not help in selling it. The discovery of this fact has necessitated a complete and costly revamping of the sales structure of this company, and loss of time with a material having such a style element is a serious thing. A case of insufficient market study and analysis, you say. Perhaps so, but what of the following instance?

A large and successful manufacturer of wood products, a journeyman carpenter himself, thoroughly familiar with tools and a large employer of carpenters, hit upon an idea to improve the old-fashioned hand screw used by all carpenters. Here was a case where it seemed perfectly reasonable to suppose that the manufacturer knew his market.

Yet after he had spent a year perfecting his device, thoroughly testing it in his own shops, and spent considerable money equipping a plant to produce it, he discovered that carpenters would not buy it. Why? Nobody seems to know exactly, even today, six or seven years later. Apparently it is a case of sales resistance built up by unbreakable custom and habit among carpenters.

Similar examples of the difficulties of marketing building materials could be carried on to some length. Wall paper manufacturers have come to the realization that modern business demands the elimination of the wall paper jobber. Conversely, the manufacturers of substitute stones in the form of wall boards, have had to educate local lumber dealers who are in effect jobbers, in the ways to stock and sell a material ordinarily outside their realm. A manufacturer of enameled brick, after 20 years of selling his material as a utilitarian product, now sells it as a decorative medium with astonishing results. Similarly, a window ventilating device, not meeting with success as a hardware item, attains immediate results when sold to architects as a ventilating system.

So you see, as our sleepy old giant looks abroad, he gets more than the expressive "eyeful." But out into the confusion he must go to do the job that has already been too long postponed.

But, if certain conditions and situations confronting the manufacturer selling products to the national building materials market make the future appear dark, other factors present a rosier and more pleasant aspect.

Offers Unexcelled Opportunities

To begin with, the building industry presents opportunities for wealth and service exceeded in no other line of human endeavor. Because of its exacting requirements it may never become a young man's

business in the sense that others are. But it can, will and must, take unto itself newer and more youthful ways, and in doing so offers to those who shoulder the burden of the change prizes commensurate with the effort.

Let not the confused and bewildered manufacturer earnestly seeking the answer to his new market problem turn aside from the task as unworthy. Such a shirking of responsibility would not be entirely unnatural from the older and richer of the industry, but building needs these older and more experienced heads as they were never needed before.

The prize far transcends dollars. It is better shelter for the nation. An awakened industry will produce better products in the sense that they will be designed more closely for their needs. Better and more modern style will mean homes better adapted to human needs. Goods will be easier to get and easier to pay for. There will be a wider and better understanding of the proper use of building materials. Even if building prices do not go down, we will all get more for our money and will have better, more beautiful homes and factories.

Another bright point in the picture is the inherent stability of the industry, based on the stability of land itself. Except for temporary setbacks, building has always enjoyed an increasing growth. It always has been, is and always will be, the second largest market in American industry—the market in which demand does not have to be created but always exists.

A Stable Industry Throughout

This national market stability also has its counterpart in the separate branches of the industry. It is not within my knowledge that any separate branch of the building industry, once it has become a recognized entity, has ever lost its entity. Quite naturally, individuals within a branch will conflict with one another. But the manufacturer producing roofing, plumbing, hardware, brick, glass or whatever can always have the assurance that no building will ever be completed without this sort of product.

Finally, and most important of all, the reassuring fact about this great industry's future is the unusual way in which its buying factors function.

In no other line of human endeavor does such vast purchasing power lie in the hands of so few people. This small group is divided into four clearly defined sub-divisions—owners, architects, contractors and building supply dealers.

In the entire country there are only about 8,000 architectural offices, nearly 200,000 contractors or sub contractors and approximately 25,000 material dealers. These men are easy to reach either by personal or printed selling.

A little study will make it evident that architects, contractors and dealers are far

more interested in and concerned about the purchase of material from the manufacturer than they are about its resale to the consumer. So, without loss of time or waste of money, the manufacturer can take his wares quickly and cheaply to three of the possible four buying factors.

Nor need there be concern about spending money to reach this market. Architects, contractors and dealers may arrive at decisions about material slowly, may not even be able to buy at once, but when convinced can be counted on as customers who will say "yes" at the buying moment with a conviction based on knowledge and experience, and not on a passing impulse. —*Reprinted from the October, 1929, Number of Nation's Business.*

Thomas F. Armstrong, President of Conkling-Armstrong Terra Cotta Company, also President of the Manufacturers' Club of Philadelphia, was elected president of the Philadelphia Builders' Exchange & Employers' Association at the annual meeting held at the Bellevue-Stratford last week.

Other officers elected were Wm. M. Anderson, first vice-president; H. G. Kepler, second vice-president; W. Nelson Mayhew, third vice-president; Thomas S. Gassner, treasurer. The directors are Walter Bodey, D. F. Durkin, Jr., Robert D. Hamilton, John P. Holleran, C. Albert Kuehnle, John S. McQuade, E. B. Newcomer and Joseph M. Steele.

Selby, Battersby & Co., floorcrafters, announce the removal of both business offices and plant from 810-12 Noble Street, Philadelphia, to larger and more modern quarters. The factory is now located at 49th and Botanic Avenue, Philadelphia. Improved facilities have been provided, and the additional advantage of

sidings from three trunk line railroads has also been acquired.

The new business offices are at the N. E. Cor. of 33rd and Arch Streets, first floor, Wilford Building, Philadelphia. The new location is more convenient—only two blocks from West Philadelphia Station.

Selby, Battersby & Co. products include Selbalith, Selbatex, Tiletex, Good-year Rubber Tile, Mundet Cork Tile, Selbatraz Terrazzo, Levelite, Bird Tile.

At this time of year it is a pleasure to wish all our subscribers, advertisers and readers the Compliments of the Season.

The architectural and building trades have had a somewhat turbulent year, due to the unsteadiness of finances which has caused delay in prospective work, but considering the year as a whole we have a lot to be grateful for. 1929 will not be far behind 1928 in the total volume of building work throughout the country.

The prospects for 1930 are bright, due to the great stimulus given business by President Hoover and his conferences in Washington.

A great proportion of money that was tied up in the stock market will now be available for building purposes, as the lure of making money quickly, in stocks, has been somewhat checked. Conservatism regarding investments will prevail for some time, due to the great set-back many investors received during the recent collapse of the stock market. This will release funds to go into building.

As it is customary at this time to wish everyone "Happy Days" and "A Prosperous New Year," it is not amiss to direct the attention of the builders as well as the sub-contractors to the fact that much more happiness and much more profit will be available if the practice of huckstering bids by a great proportion of

the contracting industry would be abolished.

Why not give the sub-contractor a profit on his portion of the job? No builder wants to work for love, and it is only natural that the sub-contractor wants to make a fair profit on his job as well. If all general contractors will make a practice of giving the low, responsible sub-contractor his portion of the work without huckstering the bid, everybody would be happier through the year.

Sub-contractors, likewise, should bear in mind that if they expect the general contractors to eliminate huckstering, it is well for sub-contractors to make a resolution not to voluntarily offer to cut bids once they are submitted. The fault is not entirely on the general contractor, as many times the sub-contractor, after putting in a bid, will offer to shade it to get below his competitor.

Every sub-contractor should have sufficient backbone to abide by his bid once it is submitted. The general contractor will then realize that the first bid is final and will not resort to huckstering.

This is the best way we can suggest to the building trades to have a Happy and Prosperous 1930.

While the volume of construction activities continued to be maintained at a level approximately equal to that of last year, and therefore continued to draw on the reserve of contracts awarded previously, there are no definite statistical indications as yet of the expected increase in the volume of contract awards. This was announced by the Associated General Contractors as a result of a statistical survey of construction.

Construction job activities during November as measured by shipments of basic construction materials took a seasonal decline of eight points to Index number 225. The total volume of construction performed during the first eleven months of 1929 as revealed by these figures is approximately equal to the total volume on record for the corresponding period of 1928.

The first indication of a revival in the planning for new construction was seen during the month in the increase of long term state and municipal bond issues which totaled \$118,000,000 for October. The average monthly figure for bond issues during the first ten months of this year was \$109,000,000, compared with \$110,000,000 in 1928 and \$124,000,000 during the corresponding period in 1927.

The increased availability of funds for financing construction through mortgage loans or bond issues has been looked to as a factor which should cause an increase in construction contract volume ever since the stock market decline. It is conceded, however, that a period of adjustment of accounts must be passed through before that effect may be seen in statistics.

A portion of the money released from Wall Street is said to have been temporarily absorbed in taking over mortgage paper on existing buildings which was held by bank clients who were hit in the market. As such seasoned securities find a readier market than new mortgage issues, the financing of new construction has been delayed pending this adjustment, according to the view of the Associated General Contractors.

BIG SPORT ARENAS CASH IN ON AIR CONDITIONING

Chicago Stadium Freezes Ice for Rink and Cools Air with Same Plant

The nation's big sport arenas are following the lead of the theatres in cashing in on the advantages of artificial cooling and controlled ventilation for the health and comfort of the customers.

Through the torrid, sultry days of the summer months, thousands of sport fans in many cities like Detroit, Cleveland, Chicago, Philadelphia, Pittsburgh, Boston and New York, enjoyed watching their favorite games in the balmy temperatures and humidities of a veritable Lake Placid. The result is that maintenance of really comfortable air conditions with

cooling has proven a great boon to indoor sports and is wiping out deficits for the promoters.

One of the most recent of the huge sport arena enterprises to prove the box office appeal of air conditioning during the hot weather, particularly, is the Chicago Stadium—a monument to sportdom. More than 600,000 cubic feet of washed, conditioned air are delivered each minute into the immense inclosure of this building.

In his insistence that the Chicago Stadium should be a civic monument dedicated to sports and public entertainment encompassing the best available in every feature of modern equipment, Patrick Harmon, its head, had placed paramount importance upon ventilation and upon the refrigeration equipment which has served alternately for freezing the ice on the skating rink or for cooling and de-humidifying the air in the great auditorium during muggy summer weather.

In discussing controlled ventilation and refrigeration, Mr. Harmon said that during his long experience in mass entertainment he had always been disturbed by the extreme conditions of discomfort to which the crowds were subjected, primarily due to bad ventilation.

He felt that it was an obligation to the public to provide in a modern building, such as this stadium, only the most healthful, invigorating, atmospheric conditions and that he was sure this feature would serve as an added and profitable attraction to the many events which will be presented.

Mr. Harmon stated that during the planning of the structure he had been forced to waive aside the advice of many of those near him in the consideration of ventilation and refrigeration equipment and to institute an investigation of all that had been done in the conditioning of air within large buildings. This involved tours to other cities. Great theatres, such as the Roxy and new Paramount in New York, were visited. Investigations led even into great industrial plants, where "made-to-order weather" has long served to create the atmospheric conditions most suited to the efficient production of such sensitive materials as Rayon, tobacco and textiles. Experts from many fields were called in to contribute their opinion.

The air conditioning system draws air from out of doors into large spray chambers, wherein it is washed and completely freed from all dust and contamination which aerologists now call "air sewage." Within this system also the temperature and humidity are automatically adjusted to produce the conditions of maximum comfort within the stadium. The air is distributed through a metal duct system to carefully designed and located outlets throughout the stadium.

MODERNIZING PLACES A NEW VALUE ON THE HOME

By C. A. STERLING,

Secretary, Capitol Building and Loan Association, Topeka, Kan.

From the American Building Association News

Home modernizing with us is not a hobby, neither is it any longer an experiment. Several months before the national organization started, we had begun this program and convinced ourselves that it paid, not only in dollars and cents to the borrower, and to the association, but to the community and to the city.

People are constantly changing from the old to the new, in an attempt to keep up with the modern trend. It is only natural that a housewife should want convenience. It is only natural that she would want new furnishings, and the furnishings of today require a background. It is not surprising that the wage-earner of the family becomes dissatisfied in paying money into an old dilapidated home. He wants something to which he may proudly point and say, "This is my home, of which I am proud," and really have something to show to justify this statement.

We have found borrowers becoming delinquent, who, when questioned, have really had no reason for not making payments, except that they had become dissatisfied and might let the mortgagee take the place. When questioned about the neighborhood, we would find that they had no objection to it. They were close to schools, churches, city playgrounds and parks for children. The taxes were not high, the house spacious and comfortable, but the kitchen was almost unbelievable and could never be made to suit. It had an old flatrim sink in the corner. An old cabinet built over the chimney. One long narrow window for light and practically no ventilation. It was so poorly arranged that they felt that nothing could be done about it.

We suggested that our appraiser be given the opportunity to study it with them and in a few days he gave his report. For about \$275.00, he thought the kitchen could be rearranged. A contractor's estimate verified these figures and the work started. The long narrow window was removed and two short twin windows were installed just high enough to allow a fine sink to be installed, and the little old dreary cabinets by the chimney removed. In this end of the kitchen, where the old kitchen cabinet once stood, was ample space for the ice-box. There was no window in this end of the room. A small one was installed just above the ice-box and a door with a panel of glass in the upper part, replaced the old paneled door that led to the back porch. New in-laid linoleum of modern pattern and design was put on the floor and the kitchen finished in bright colors.

With this slight expenditure, the home has been made more livable to the family, more valuable to the owner, and more salable, should they wish to sell. This is only one case out of the many that come to us each month.

This modernization idea cannot be entered into half-heartedly. We realized that the average contractor was not able to originate plans for modernizing. With this in mind, we found an architect who would lend his services for plans for \$10.00, and with this price established, it was not difficult to convince the borrower that his services were important. Then we recognized the fact that we ourselves must be experienced in this work before we could competently advise other people, and so we took our own houses and began to modernize them. From the experience we gained in this we developed until we had no fear in recommending policies to our borrowers. The success of these experiments has been proven by the response from the people who have rented or purchased these houses.

Modernization does not mean that a house must be entirely reconstructed from basement to garret, but it does mean that the important element be supplied. In one house it is the kitchen, in another it is the bath, in another it is the exterior. Nearly two years of experience in this work have proven to us that paper and paint are not the most important elements in home modernization. Massive dark porches have given way to compact entrances, allowing more light to enter the house and clearing the way for much better ventilation. Porch scrubbing threatens to become a lost art and this is one drudgery that the housewife is glad to see go.

The average house requires new hardwood floors, new light fixtures, wall plugs and floor plugs for electrical equipment. The living rooms need to be larger in order to accommodate the more massive furniture of today. The dining room can be smaller and sometimes entirely eliminated, if a spacious breakfast nook has been provided.

The kitchen and bath are the two most important elements in modernization, unless it be the heating. More women are made unhappy in this world because of poorly arranged kitchens than through almost any other cause. Many unhappy days are begun, and ended, because of poorly arranged bathrooms. Imagine arising in the morning, still weary from life's heavy burdens, and going into a bathroom and trying to find that old plug for the lavatory, which has long since become detached from the chain. And trying to shave, using cold water, gazing into a mirror about the size of your hand, and in the meantime, trying to hold your head on one side so that the ceiling light will not shade the mirror. Then, waiting for ten minutes while enough water runs through the old faucets into the old tub

so that you can take a hasty cold plunge. Then, if you go down stairs to breakfast, which the wife has spread on the kitchen table, which is half covered with lard-pails, breakfast food boxes and all sorts of kitchen equipment, because there is no cupboard space for it, and the toast happens to be burnt a little bit, what a terrible start a man would have toward a perfect day. Contrast this with the modern bathroom of today, supplied with hot water from the automatic heater in the basement, a shower-bath instead of a plunge, and a man will go to his breakfast whistling, eat burnt toast, and never know the difference. He won't forget to kiss his wife goodbye when he starts to work and she will sing about her work and everybody will be happy.

Another very important element is the heating. The type of furnace should be suited to the house and while this might be gauged by the amount of money that is to be spent, yet there are certain types of houses that are suited to only one method of heating and this should be carefully considered. Many unhappy situations are found where the house is improperly heated. It takes more than the advice of the furnace salesman as a rule to decide this question. It takes the practical experience of some one in your institution.

The average individual is not able to see any beauty in a kitchen where the dirt on the floor is an inch thick and the corner is piled full of tin pans. They cannot imagine just how a room would look with the window changed and built-in features added. It is useless to try to rent or sell this kind of an arrangement to any woman who has the least sense of pride. This work should all be done before she is ever taken to the house and asked to pass judgment upon it. Many a house fails to sell simply because some one element is missing.

We recall the case of one little house that was a perfect beauty from the outside. The interior was nicely arranged and everything in excellent condition, but it was some little distance from city water and there was no sewer. The property was too good for a poor purchaser and yet not good enough for the family who could really afford to own it. We finally awoke to this situation and installed city water, bath, and septic tank, and the property sold. It required only this small added touch to make it desirable.

There is no doubt but that many foreclosures have been avoided in our association and many discouraged home-owners developed into contented ones through modernization. During the past, our association has been compelled to handle quite a number of homes and it has been a real problem to take these and either dispose of them, or rent them. Anyone who has had any experience will know, that rarely ever is a home given up that is in good condition.—*Home Modernizer*.

Insurance
Company"*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

This Hotel was Built During the Winter Months with the Aid of "ANTI-HYDRO"

Freezing weather did not interrupt the work on this building. "ANTI-HYDRO" was added to the brick mortar throughout this building as well as the cement plaster coat and floor topping of the basement and boiler room.

In addition to preventing the mortar and concrete from freezing, "ANTI-HYDRO" produced a stainless mortar and eliminated the possibility of efflorescence coming from the mortar. It made a waterproof basement, guaranteed for five years by the manufacturers.

"ANTI-HYDRO" has many advantages for cold weather work. It permanently waterproofs, dampproofs and hardens portland cement mixtures in one operation. It also lowers the freezing point to 15 degrees F., and enables you to work right on through extremely cold weather without delays.
